

Magic Quadrant for Business Intelligence Platforms

6 February 2012 ID:G00225500

Analyst(s): John Hagerty, Rita L. Sallam, James Richardson

VIEW SUMMARY

In 2011, business users continued to exert significant influence over BI decisions, often choosing data discovery products in addition to/as alternatives to traditional BI tools. An avalanche of new use cases, content types and interaction models expands the scope for tomorrow's BI platforms.

Market Definition/Description

This document was revised on 10 February 2012. For more information, see the [Corrections page](#) on gartner.com.

Business intelligence (BI) platforms enable all types of users — from IT staff to consultants to business users — to build applications that help organizations learn about and understand their business. Gartner defines a BI platform as a software platform that delivers the 14 capabilities listed below. These capabilities are organized into three categories of functionality: integration, information delivery and analysis. Information delivery is the core focus of most BI projects today, but we are seeing an increased interest in deployment analysis to discover new insights, and in integration to implement those insights.

[Return to Top](#)

Integration

BI infrastructure — All tools in the platform use the same security, metadata, administration, portal integration, object model and query engine, and should share the same look and feel.

Metadata management — Not only should all tools leverage the same metadata, but the offering should provide a robust way to search, capture, store, reuse and publish metadata objects such as dimensions, hierarchies, measures, performance metrics and report layout objects.

Development tools — The BI platform should provide a set of programmatic development tools and a visual development environment, coupled with a software developer's kit for creating BI applications, integrating them into a business process, and embedding them in another application. The BI platform should also enable developers to build BI applications without coding by using wizard-like components for a graphical assembly process. The development environment should also support Web service integration in performing common tasks such as scheduling, delivering, administering and managing. In addition, the BI application can assist and track events or tasks allotted to specific users, based on predefined business rules. Often, this capability can be delivered by integrating with a separate portal or workflow tool.

Collaboration — This capability enables BI users to share and discuss information, BI content and results, and/or manage hierarchies and metrics via discussion threads, chat and annotations, either embedded in the BI platform or through integration with collaboration, social software and analytical master data management (MDM).

[Return to Top](#)

Information Delivery

Reporting — Reporting provides the ability to create formatted and interactive reports, with or without parameters, with highly scalable distribution and scheduling capabilities. In addition, BI platform vendors should handle a wide array of reporting styles (for example, financial, operational and performance dashboards), and should enable users to access and fully interact with BI content delivered consistently across delivery platforms including the Web, mobile devices and common portal environments.

Dashboards — This subset of reporting includes the ability to publish formal, Web-based or mobile reports with intuitive interactive displays of information, including dials, gauges, sliders, check boxes and traffic lights. These displays indicate the state of the performance metric compared with a goal or target value. Increasingly, dashboards are used to disseminate real-time data from operational applications or in conjunction with a complex event processing engine.

Ad hoc query — This capability enables users to ask their own questions of the data, without relying on IT to create a report. In particular, the tools must have a robust semantic layer to allow users to navigate available data sources. These tools should include a disconnected analysis capability that enables users to access BI content and analyze data remotely without being connected to a server-based BI application. In addition, these tools should offer query governance and auditing capabilities to ensure that queries perform well.

Microsoft Office integration — In some use cases, BI platforms are used as a middle tier to manage, secure and execute BI tasks, but Microsoft Office (particularly Excel) acts as the BI client. In these cases, it is vital that the BI vendor provides integration with Microsoft Office applications, including support for document and presentation formats, formulas, data "refreshes" and pivot tables. Advanced integration includes cell locking and write-back.

Search-based BI — This applies a search index to both structured and unstructured data sources and maps them into a

classification structure of dimensions and measures (often, but not necessarily leveraging the BI semantic layer) that users can easily navigate and explore using a search (Google-like) interface. This capability extends beyond keyword searching of BI platform content and metadata.

Mobile BI — This capability enables organizations to deliver report and dashboard content to mobile devices (such as smartphones and tablets) in a publishing and/or interactive (bidirectional) mode, and takes advantage of the interaction mode of the device (tapping, swiping and so on) and other capabilities not commonly available on desktops and laptops, such as location awareness.

[Return to Top](#)

Analysis

Online analytical processing (OLAP) — This enables end users to analyze data with extremely fast query and calculation performance, enabling a style of analysis known as "slicing and dicing." Users are (often) able to easily navigate multidimensional drill paths. And they (sometimes) have the ability to write-back values to a proprietary database for planning and "what if" modeling purposes. This capability could span a variety of data architectures (such as relational or multidimensional) and storage architectures (such as disk-based or in-memory).

Interactive visualization — This gives users the ability to display numerous aspects of the data more efficiently by using interactive pictures and charts, instead of rows and columns. Over time, advanced visualization will go beyond just slicing and dicing data to include more process-driven BI projects, allowing all stakeholders to better understand the workflow through a visual representation.

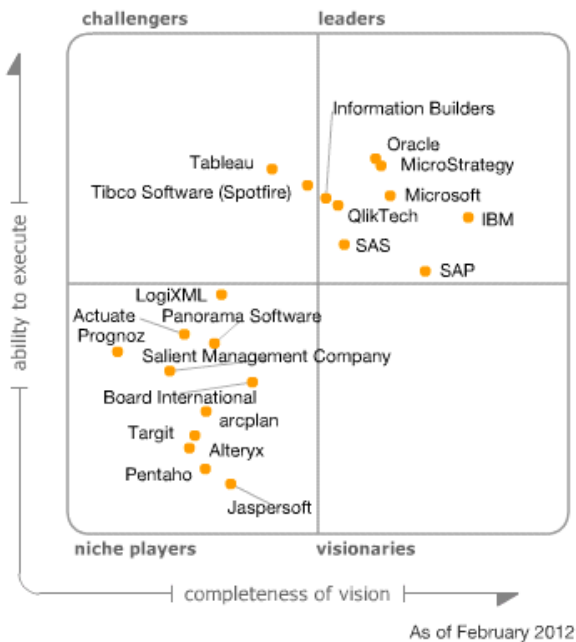

Predictive modeling and data mining — This capability enables organizations to classify categorical variables and to estimate continuous variables using advanced mathematical techniques. BI developers are able to integrate models easily into BI reports, dashboards and analysis, and business processes.

Scorecards — These take the metrics displayed in a dashboard a step further by applying them to a strategy map that aligns key performance indicators (KPIs) with a strategic objective. Scorecard metrics should be linked to related reports and information in order to do further analysis. A scorecard implies the use of a performance management methodology such as Six Sigma or a balanced scorecard framework.

[Return to Top](#)

Vendor Strengths and Cautions

ARCPLAN

Strengths

arcplan's customer base is firmly established in Western and Central Europe, with nearly 90% of customer references based in those sectors. Sixty-five percent are based in Western Europe, compared with an average of 27% for the rest of the survey respondents.

The top reasons why customers select arcplan are data access and integration (top quartile), functionality, and ease of use for users. Additionally, references indicate that report design complexity is a major contributing factor in selecting this vendor, along with the availability of skills provided by an extensive partner network. Customers rate arcplan's end-user ease of use in the to

quartile, compared with other vendors in this report, and indicate reporting, dashboard, and scorecard functionality as being ab average. They also use OLAP options more aggressively than the average for other vendors in the survey.

The average tenure of arcplan's customers is 7.2 years, the longest of any vendor in this Magic Quadrant. This indicates long-te customer satisfaction. However, 10% of customers report a definite plan to replace the software in three years, which tempers long-term satisfaction rating. While the rating is lower than last year's survey response, it is above the average for all vendors i year.

arcplan's unified platform incorporates guided and self-service analytics, along with budgeting, planning and forecasting capabilities and integrated search and collaboration functionality. The breadth of this vendor's platform differentiates it from oth pure-play BI vendors in this Magic Quadrant that lack an integrated planning capability.

Cautions

arcplan is considered the BI standard in less than 35% of its reference accounts, near the bottom of all vendors in this survey (l nearly double last year's response). A substantial part of arcplan's business is linked to SAP — 50% of references indicate that i their ERP standard — and sales and marketing efforts from SAP for BusinessObjects products and the High-Performance Analytic Appliance (HANA) platform must be considered a competitive threat to arcplan's near- and mid-term sales prospects. Interesting HANA may also act as an accelerator to arcplan's growth as another source of data for arcplan to analyze.

Overall, reference customers scored arcplan's product capability below the average for all vendors in this survey; Microsoft integration was noted as a particular weakness. Performance concerns, specifically the inability to handle required data volume: as well as overall system performance, were noted as problem areas with the software. Given relatively small data volumes (les than 500 gigabytes [GB] of data on average, in the bottom quartile of survey respondents), this is troubling. It is important to n that arcplan sits on top of existing data sources (for example, SAP NetWeaver Business Warehouse [BW]) that may have performance constraints of their own, making it less clear where performance concerns lie.

Scores for product quality, customer experience and platform integration were also below the average for all respondents, contributing to less positive execution scores in this year's Magic Quadrant results. arcplan should put a specific plan in place to address concerns over products and customer experience. It would be unfortunate to lose long-term customer loyalty without addressing the specific issues noted by customers in this survey.

[Return to Top](#)

ACTUATE

Strengths

In 2011, Actuate turned an important corner. It has seen multiple consecutive quarters of double-digit license revenue growth, with a stronger emphasis on Business Intelligence and Reporting Tools (BIRT)-based license revenue (marketed as the Actuate product line), as well as improved customer satisfaction ratings in this year's Magic Quadrant survey, largely because a majority ActuateOne's customers took part. After many years, it appears that the company's open-source strategy is finally paying some dividends. While there are differences in responses from clients on older vs. newer product lines, they are less pronounced than last year. This has resulted in a higher Ability to Execute rating in the Magic Quadrant.

The top reasons why companies choose Actuate products are functionality, ease of use for developers, enterprise application integration, and ease of use for end users. The products are often used to develop information-based applications for internal & external constituents. In fact, support for large numbers of concurrent users was a leading buying motivation for Actuate customers — rated No. 1 among all vendors in this survey. While references report a relatively modest 510 user average, Gartner knows of several implementations where tens of thousands of consumers access Actuate-generated content.

When complex reporting and development requirements are paramount, Actuate products stack up well against competitors. Reference accounts rated it as the No. 2 vendor overall for this requirement.

The company has shown more progress in the transition of its product portfolio and customer base to BIRT-based products. Actuate reports that BIRT license revenue is growing significantly as a percentage of total license revenue, and the BIRT onDemand cloud offering is gaining new customers, with 7% of references saying they use it today.

X2BIRT (the rebranded Xenos acquisition) allows customers to access and query non-traditional/unstructured data sources including archives, statements and print streams. When needed, this is a critical component.

Cautions

Customer references note two problem areas that prevent further deployment of the products: cost and quality of support. Cos has been a perennial concern for Actuate's customers, and it remains one this year, albeit less so than in prior years. Cost is als the No. 1 reason that broader deployments are blocked. Quality of support is noted specifically for BIRT products, resulting in a lower than average support rating for the firm as a whole. This can be troubling for existing customers that are considering a migration from e.Report-based products.

Overall product quality ratings are also lower than the average for all vendors this year, as are customer experience and sales execution scores. Fortunately, they are better than last year. Actuate's investment in these areas in 2011 is showing payback; company must continue to show improvement in these areas next year to maintain positive momentum in terms of its execution

Actuate's customers report using a narrower range of functionality than for other vendors — one of the lowest in this year's vendor analysis. In addition, only 45% report that they use the products as their BI standard, below the average for all vendors but, again, higher than last year.

Based on inquiry and survey results, the company has made progress in changing its reputation as a company that's difficult to work with. Organizations considering Actuate's products should check references closely to verify the product fit for use case(s) under evaluation. The company's transition continues; but it's a long haul that will require management attention and superb execution.

[Return to Top](#)

ALTERYX

Strengths

A new entrant to the 2012 BI platforms Magic Quadrant, Alteryx (formerly SRC) is based in Irvine, California, and was founded in 1997 with a strong foundation of data integration and advanced analytic capabilities. Today, it specializes in delivering a business analytic platform to develop geographic-based applications with significant external content input to enrich business decision making. A strong network of partners often develop their own applications using the Alteryx platform for sale to specific regional and/or industry segments. The product is licensed by subscription.

Customer references indicate that Alteryx's products are used for highly complex analytics on large data sources (approximately terabytes [TB] on average). The company received the highest complexity of use scores (meaning the variety of analytic use cases of any vendor evaluated in this year's Magic Quadrant). Ad hoc analysis — from simple to complex — is a demonstrated strength and is rated highest by references across all vendors. Predictive analytics is also highly rated, with many customers using Alteryx products for decision support in sales and marketing scenarios, including prospect targeting or store placement based on population demographics — again, largely based on geographic intelligence.

The company's integration heritage is evident, as references indicate that over 60% of data used in analyses comes from external sources. In addition, the company scores in the highest quartile for use of unstructured data and use of content analytics. Integration is also one of the primary reasons that clients choose Alteryx.

Reference customers also gave the company above average support and product scores. Additionally, they indicated that the product is selected for its support of large data sources and its performance against those large datasets.

The company received significant funding in 2011 to expand its sales and marketing efforts and to broaden its product/company vision to include more analytic scenarios beyond geographic intelligence.

Cautions

Alteryx is deployed very narrowly within its reference clients, operating on average within single departments/functional areas, and with fewer than 50 users per implementation. For survey respondents, the most common factor blocking expansion was competition with a BI corporate standard. Given its relatively narrow geographic use cases, Alteryx is a classic niche vendor. While the company does plan to expand to more sophisticated predictive analytics workbench capabilities in 2012 and beyond, today a highly specialized product.

Given those analytic strengths, customers do have concrete product concerns. They are not happy with the products' data visualization capabilities — rated the lowest of any vendor included in this year's Magic Quadrant. Clients note concerns about ease of use for developers and users that are preventing expansion. With ease of use and data visualization driving many BI evaluations, Alteryx needs to address these criticisms quickly or risk falling behind the market. Direct conversations with partners reinforced these survey findings. Better visualization is on the product road map for 2012.

The average tenure of reference customers was 3.5 years — slightly below the average tenure of all respondents in the Magic Quadrant survey — yet over 10% plan to replace the vendor in the next three years (or are considering doing so), which is above the average for all respondents. The short tenure and high replacement factors indicate that the products could be used more tactically than those of other vendors in this survey. As a counterpoint, Alteryx customers continue to renew their subscriptions at exceptionally high rates.

All Alteryx references who responded to the BI Platforms Magic Quadrant reference survey were North American. The company has limited presence outside this market.

[Return to Top](#)

BOARD INTERNATIONAL

Strengths

Board International offers a well integrated BI platform that combines planning, reporting and analysis capabilities in a single integrated product.

Historically, Board has focused on developing and deploying custom analytic applications (on the same foundation as its corporate performance management [CPM] applications). This unified approach remains its key value proposition, and is evident in its usage — at 29%, a higher proportion of Board users are monitoring their performance via a formal scorecard than those of any other vendor surveyed for this Magic Quadrant.

Board's "toolkit" approach to BI application development handles database creation and updates, data presentation and analysis and process modeling in a single graphical environment without programming. This is a differentiator for the company: more Board customers selected it due to a perceived lower implementation cost and effort than for any other on-premises BI vendor (only pure cloud vendors ranked higher).

Board has worked hard in recent releases to deliver an interactive, visually aesthetic experience for users (via its extensive use of Windows Presentation Foundation and Silverlight), and customers now rate ease of use for end users as the top reason for selecting Board. In fact, when considering overall ease of use (for end users and developers), only data discovery vendors rate higher — no mean feat given Board's more traditional OLAP-led approach. Board is innovating at the back end too, adding new hybrid in-memory technology to its offering in 2011 (see "Need for Speed Powers In-Memory Business Intelligence").

Board's ability to meet both BI and CPM (particularly planning) needs in a single product makes it a strategic choice for the firms using it — it is considered a BI standard by 83% of its surveyed customers, the highest of any vendor featured on this Magic Quadrant. Along with this is a strongly positive perception in its customer base regarding Board's future as their BI supplier.

Cautions

Board offers a functionally complete and capable BI product. However, survey feedback from Board's customers about its BI platform functionality fell below the average in most areas this year. Its customers rated it above or close to average in four functional capabilities: reporting, dashboards, development tools and BI infrastructure.

Board's customers also report below average product quality (with the lowest rating of any vendor on the Magic Quadrant this year). This, taken in combination with customer support rated in the lowest quartile, amounts to a diminished customer experience for Board users. It should be noted that innovation, and the kind of growth experienced by Board in 2011, can be disruptive to an existing customer base. According to the vendor it is likely that its customers are experiencing issues with the quality of its latest versions, due to the functional innovation they contain. If this is correct, the issues with customer experience should be short-term.

Board's core markets are in Europe, with emergent adoption elsewhere. Board is looking to grow its global presence — it now has operations in 12 countries worldwide, adding three new ones in 2011 in China, Japan and Mexico. However, its direct presence tends to be limited outside Europe — it has less than 10 full-time equivalents in the U.S., for example.

Firms considering Board should talk to references that can vouch for its use at scale. It's evident that Board's customers are smaller firms on average, and its deployments are among the smallest of the vendors covered in this Magic Quadrant. The Board customers surveyed had 139 users on average, compared to the survey average of 1,176 users. Board is getting traction in smaller firms (notable recent wins include Puma, Triumph, Giorgio Armani and Nike US), so this survey finding may reflect historical buying patterns rather than technical limitation.

Board's technology remains Windows-only, which limits its potential to expand into some segments of the enterprise market.

[Return to Top](#)

IBM

Strengths

IBM maintains its leading position on the Completeness of Vision axis for this year's Magic Quadrant. The company takes a holistic approach to what it calls Business Analytics and Optimization (BAO), combining comprehensive software, hardware and services in a coordinated market offering. IBM's business analytics software portfolio includes a unified BI, analytics and performance management platform, and is complemented by IBM information management software and appliances (Netezza, for example). Services are made up of a consulting line of nearly 9,000 people, which is a growing part of IBM Global Business Services (GBS). IBM can offer both a tools-based and/or a solution-driven offering, along with significant vertical expertise, to customers and prospects.

In 4Q10, IBM introduced its latest business analytics platform, IBM Cognos 10. Throughout 2011, additional capabilities have been released and customer adoption has begun in earnest. Cognos 10 references who responded to this year's Magic Quadrant survey painted a very interesting snapshot — on average nearly 4,000 users, over 12 TB of data, broad functional use, and very high platform integration scores, all at or near the top of all ratings for all vendors in this report. Overall, Cognos 10 references were significantly more satisfied than Cognos 8 customers, who were the majority of IBM's survey respondents. While some indicated that upgrading from Cognos 8 to Cognos 10 had some complexity, the majority rated it as straightforward or very straightforward. This bodes well for IBM's future ability to execute, providing the firm delivers superior service and support and problem-free software.

The average tenure of IBM respondents was seven years, second highest of all vendors in this survey. Gartner often hears this long-standing customer commitment in inquiry, and this represents a strong customer loyalty factor. This year, less than 7% of references noted that they are planning to discontinue use of the software in the next three years (or are considering doing so) which is significantly lower than last year's result.

Advanced analytics is a particular IBM strength. The company's SPSS software continues to advance nicely, readily allowing IBM to bid for predictive analytics and statistical use cases. Customers rated IBM's predictive capabilities in the top quartile of all vendors. A secret weapon at IBM's disposal — IBM Research — delivers another level of research and development prowess to the overall IBM value proposition. For example, Watson, the Deep Question and Answer system that interprets natural language and scores possible answers based on probability, is a visible example of IBM Research at work. While not a part of the Cognos 10 platform, it demonstrates the depth and breadth that IBM can bring to clients' advanced analytic scenarios.

The top reasons why customers select IBM are functionality, ease of use for end users, and data access and integration. IBM's road map and future vision weighed heavily in reference decisions. In 2011, IBM delivered a new Cognos 10 mobile application for the iPad that is included free in existing user roles. In early 2012 the company will introduce Cognos Insight, a personal, desktop BI product that enables independent discovery and "what if" modeling, while also providing full interoperability with the larger workgroup and enterprise solutions.

Cautions

Twenty-three percent of Cognos 8 references indicate that performance continues to be problematic (a persistent problem for the last several years), nearly three times the average response for other vendors evaluated in this Magic Quadrant. In contrast, Cognos 10 references reported below average performance concerns. This is a sure signal that IBM must encourage upgrades to Cognos 10 without technical and/or financial disruption.

Again this year, references consider the Cognos products more difficult to implement and use than those of competitors. While Cognos 10 was rated slightly below average, other IBM products (Cognos 8, SPSS software and Cognos TM1) were deemed significantly more difficult. These are cited as two major reasons that limit expanded BI deployments with Cognos 8. As such, improved system administration and end-user usability were major development themes of the Cognos 10 release. References indicate that Cognos software is used largely by a consumer/casual user population. Reporting is the most extensively deployed component, followed by ad hoc query and OLAP analysis.

IBM's customers also continue to have less than optimal customer experiences, with support and sales interactions, along with product quality, rated in the bottom quartile of all vendors reviewed in this report. References also rate product functionality slightly below the average for all vendors. The bright spot is that Cognos 10 references rated product functionality near the top of all vendors, and support, sales and product quality were rated better than for Cognos 8. These issues remain IBM's Achilles' heel and will limit its ability to raise execution scores next year unless action is taken quickly.

License cost continues to be another source of customer concern across all products in the IBM business analytics portfolio. Gartner client inquiry also bears out this concern. Higher than expected costs to upgrade from Cognos 8 to Cognos 10 have stalled some projects, but changes in configuration, user roles, and/or support costs appear to drive the increase. As a counterpoint, existing Cognos 10 users did not identify license cost as a concern.

[Return to Top](#)

INFORMATION BUILDERS

Strengths

Information Builders' customer references report strong BI functionality across the BI platform spectrum. The WebFocus customers surveyed rated it at or above average in 10 out of 14 capabilities. That said, its strongest area remains reporting: Information

Builders' customers predominantly make great use of parameterized reporting (for example, interactivity via prompts, drilling or filters) for consumers and casual users. By and large, this is the sweet spot for WebFocus.

Although the most common reason for selecting WebFocus remains BI functionality, more Information Builders users select it for ability to integrate with information infrastructure (database, middleware) than for any other vendor on the Magic Quadrant. The company's broad information management capabilities bolster its BI platform and provide differentiation from other pure-play BI competitors. WebFocus is fully integrated with the firm's iWay integration platform, which provides adapters for multiple data sources, and data federation, profiling and quality capabilities, geocoding and real-time search index management, business activity monitoring/complex-event processing, file-based integration and MDM. This integration makes Information Builders a good fit for organizations without a data warehouse and for operational reporting.

The suite has proven user scalability; Information Builders' customers reported the highest average number of end users of any vendor on the Magic Quadrant (at 3,184, almost three times the average). This ability to scale for users makes the WebFocus product well suited as a platform for building custom Web-based BI applications. Customers surveyed indicate that 46% utilize the product to develop externally facing applications, and that the single strongest business benefit they'd gained from using Information Builders is "increased customer satisfaction." Its strength in this type of deployment forms the basis of the firm's approach to software as a service (SaaS) — rather than offering its own generic BI-in-the-cloud offering, it is instead targeting third-party independent software vendors (ISVs) that want to develop and deliver their own hosted applications using WebFocus.

Overall customer experience ratings, including product quality and support measures, put Information Builders among the top vendors included in this year's Magic Quadrant. Many contributing metrics, including level of expertise, response time and time to resolution, were rated highly by Information Builders' clients. Of the company's customers, 68% had encountered no problems with its software — a top three rating.

Information Builders continues to innovate, with a new range of vertical applications for public sector needs, an entry-level offer for emerging markets (WebFocus Express), the addition of its own column-oriented staging engine for query optimization, and a joint appliance venture with Teradata, drawing on the experience of its successful offering for IBM iSeries machines.

Cautions

Shrinking revenue and market share is a concern. According to data published by Gartner, Information Builders has seen falling revenue from BI in the past three years, with a 6% fall in calendar 2010 (in a market that grew 13%). The company is being squeezed between fast growing data discovery tools and the megavendors' stack-buying agenda. While it's no surprise that 40% of Information Builders' reference customers stated that Oracle or SAP are their primary ERP systems, this does constitute a threat to the company's hold as a BI standard in those firms in the future. It should be noted that 83% of the firms surveyed stated that they had no plans to discontinue their usage of WebFocus.

While large in scale, WebFocus deployments tend to be analytically simpler than average and have a narrower scope. Beyond static and parameterized reporting, WebFocus user activity is below average in all other areas of interactive exploration and analysis of data, ad hoc analysis and discovery and scorecarding, and in using predictive analytics and/or data mining models. The final one of these points to Information Builders' inability to capitalize on its strong technical innovation — WebFocus RStat has been in the market since 2009, yet Information Builders' users report among the lowest levels of user activity in predictive analytics.

Marketing to non-IT buyers remains a challenge. Information Builders has very limited brand equity in that segment, which hinders the firm's ability to acquire new customers, and undermines its ability to sell the analytic applications which are a core part of its go-to-market strategy. The company is aware of this and has been investing in new messaging and market communications activity for these segments (in particular its "total view of customer/supplier" positioning, which leverages both its BI and information management propositions).

Limited geographic coverage remains a constricting issue. Information Builders has a limited international presence — the vast majority of its direct customers are in the U.S. While progress is being made, this is still a clear weakness for the vendor in relation to its competitors. There are exceptions: the company is doing well in Japan, where K. K. Ashisuto is a very strong partner. While the new WebFocus Express entry-level product may see downloads in Asia, Russia, Eastern Europe, the Middle East, Africa and South America (the company intends to seed new usage in these growth markets), the chief concern that Gartner hears from customers outside the U.S. — the lack of a strong ecosystem of staff skilled in WebFocus — will remain valid.

[Return to Top](#)

JASPERSOFT

Strengths

Jaspersoft offers a comprehensive, highly embeddable, open-source BI platform. The Jaspersoft Enterprise Edition, based on version 4.5 of its platform, includes JasperReports Server (which incorporates a reporting server, ad hoc query including an enhanced user interface for analysis, in-memory analysis and dashboarding), JasperReports Library, Jaspersoft iReport Designer, Jaspersoft Studio (an Eclipse-based report designer), Jaspersoft OLAP and Jaspersoft ETL (which is the open-source extraction, transformation and loading [ETL] engine from Talend), including advanced functions from Talend's commercial edition such as change data capture, monitoring, job versioning and more. Over the past year, Jaspersoft released a broad range of native Apache Hadoop and NoSQL connectors, as well as support for iPad HTML5-based report and dashboard delivery and ad hoc authoring and analysis, as well as a software development kit for building mobile BI applications on the iOS platform.

Due to its embeddable architecture, and the fact that customers can embed its software without being bound by the GNU General Public License terms and conditions, Jaspersoft earns over half of its business from more than 400 OEMs and SaaS providers that include Jaspersoft as the BI components in their software offering, as well as other businesses that integrate Jaspersoft into their internal applications. Jaspersoft also has an established partner network that includes companies such as Red Hat, VMware, IBM and Tata. Note that OEMs are not included in our survey results.

Cost is by far the most compelling part of the Jaspersoft value proposition, and the major ingredient driving its success. Customers cite total cost of ownership (TCO), license cost, and implementation cost and effort as among the top reasons for choosing Jaspersoft as their BI vendor, more often than for most other vendors in the survey. Its low-cost value proposition extends beyond low initial license cost; Jaspersoft customers also report below average overall BI platform ownership costs. Its low-cost model also makes it well suited to extranet deployments in which the number of users is often unknown. Jaspersoft customers use its platform for an above average percentage of externally facing applications, compared with most other platforms in the survey.

While Jaspersoft is primarily delivering an open-source version of mainstream BI functionality at a very low license price point, it:

product portfolio and road map includes some forward-thinking elements. These include building connectors for open-source language "R"-based Revolution Analytics for predictive analytics, those for eXo for collaboration, and those for diverse "big data" sources such as Hadoop, Hive and HBase, as well as NoSQL sources such as MongoDB and Cassandra.

Early success in cloud deployments is another strength. In 2010 the company launched Jaspersoft Live, a SaaS BI offering for proofs of concept and trial purposes. Partners can also leverage the Jaspersoft multi-tenant platform to build complete solutions for its clients. Jaspersoft will be offering BI for platform as a service (PaaS) with Red Hat and VMware, and will be embedded with Red Hat's virtualization offering.

Cautions

Jaspersoft tends to be deployed in smaller companies with smaller data volumes than the survey average, and implemented in departments rather than enterprisewide. Moreover, Jaspersoft customers view it as their enterprise standard less frequently than for the majority of vendors participating in the Magic Quadrant survey.

Even though Jaspersoft has a fully featured BI platform, it is used narrowly in organizations mostly for reporting. In fact, a higher percentage of Jaspersoft customers use its platform for static reporting than for all but one other BI vendor in the Magic Quadrant survey, although its customers rated this functionality below the survey average. Because of Jaspersoft's usage profile, the platform earned among the lowest complexity of workload scores of any vendor in the survey, and is among the most limited in terms of the breadth of use of its BI platform functionality. This usage is consistent with Jaspersoft's roots as an open-source reporting tool; its customers have not yet begun widely implementing the broader set of BI functionality now available as part of the Jaspersoft BI platform. This is also consistent with anecdotal evidence from Gartner inquiries that suggests that organizations are increasingly using low-cost alternatives, such as open-source products, to offload basic reporting functionality to lower overall BI portfolio costs, while using another BI platform as the enterprise standard.

Of particular concern is Jaspersoft's score for support, which was almost the lowest for the second year in a row, despite this being a key part of the company's subscription-based business model.

Jaspersoft has not yet distanced itself from its IT-oriented, do-it-yourself, open-source project roots. Jaspersoft earned below average scores for ease of use for both end users and developers, as well as for integration of its BI platform components (it was near the bottom for a unified semantic layer), its product quality and its performance. Despite these results, Jaspersoft customers still report below average BI platform ownership costs. Moreover, its customers maintain a positive view of the vendor's future, and report successes with Jaspersoft's product (as defined by expanded usage) over the past year. One explanation for this paradox is that the value that organizations derive from Jaspersoft's lower-cost deployments is in line with their level of investment and expectations.

The threat from low-cost alternatives with a similar value proposition is a concern, particularly given that many of these competitors have demonstrated stronger execution on key customer satisfaction measures.

[Return to Top](#)

LOGIXML

Strengths

Much like last year, LogiXML continues to deliver on its value proposition of ease of use, rapid time to deployment, "embeddability" and lower cost compared with the offerings of the traditional enterprise and open-source market players with which it competes, but with the advantage of generally higher customer satisfaction with the platform's ease of use, product functionality, support, sales experience, and product quality than for both types of vendor.

LogiXML's BI platform is sold as a single platform that includes reporting, analysis and dashboards for both IT and business use plus data integration. It also introduced mobile capabilities in 2011. LogiXML targets small and midsize businesses (SMBs), departments in large enterprises, and software/SaaS companies that embed LogiXML's solutions in their own products and applications. Similar to open-source vendors, a large percentage of LogiXML's customers are ISVs or SaaS vendors that incorporate the product because of its embeddability and low cost.

Although targeted more at BI developers and IT managers, LogiXML's products include an ad hoc reporting solution for nontechnical business users. Business-user-oriented interactive visualization is an area where LogiXML continues to improve. Some implementations, many as part of customer-facing applications, are deployed to more than 500 users — LogiXML's unlimited user license model makes it economical to do so. Compared with most other vendors in the survey, LogiXML has among the highest percentage of external users using its product for more externally facing applications (52%).

Cost is one of the primary reasons customers choose LogiXML. It is chosen more often than most other vendors for overall TCO, license cost, and implementation cost and effort. Although LogiXML tends to focus on reporting and dashboards with less complex deployments in terms of user and data size, global deployment, and breadth and complexity of use than its competitors, it has one of the lowest total costs per user in the survey.

Ease of use goes hand-in-hand with cost as a key strength for LogiXML, which is reflected by its customers giving it among the highest scores for ease of use of any vendor in the survey. The company includes interfaces for both business users and IT developers to create reports and dashboards. But its IT-oriented, rapid development environment seems to be most compelling to its customers. The environment features extensive prebuilt elements for creating content with minimal coding, while its components and engine are highly embeddable, making LogiXML a strong choice for OEMs. LogiXML customers report among the shortest time to develop simple to complex BI content of any vendor in the Magic Quadrant survey. The platform productivity features are enhanced by a robust user-community-driven website (Logi DevNet) that contains a best practices discussion forum and hundreds of sample projects, tutorials and training videos. In addition to ease of use, LogiXML earned high marks for "BI infrastructure" and "BI development tools," with an above average percentage of its customers reporting "no product-related problems for wider deployment." These results confirm LogiXML's strength as an easy to use, high-productivity developer platform.

Cautions

LogiXML is in the cross hairs of competing low-cost alternatives from open-source vendors and Microsoft. While LogiXML has received a fresh round of funding and has achieved strong market momentum over the past three years, it is still small, with more limited resources than other vendors — particularly Microsoft, open-source vendors and other large traditional BI vendors — with which they compete for roughly the same type of customer (SMBs and departments; embedded use cases, and OEMs).

LogiXML's customers tend to have smaller numbers of users and data volumes (less than half and less than one third of the survey average).

average, respectively), while a majority do not consider it their BI standard. A key test of LogiXML's market momentum beyond its current SMB and departmental target market (and its ability to make upward progress on the Magic Quadrant in the future) will be its ability to expand its footprint beyond single or multiple departments, and become or replace the incumbent enterprise BI standard in a larger percentage of its accounts. LogiXML currently focuses on the SMB and OEM space, where pervasive and large enterprise deployments are less common.

While LogiXML has an above average overall product rating, its sweet spot is clearly parameterized and static reporting and dashboards, which are used by the majority of its customers. In fact, 84% of its customers use its Logi Info product (reporting and dashboards), while 29% use its ad hoc product. LogiXML's reporting and dashboard capabilities also are rated higher than its ad hoc analysis, OLAP and interactive visualization capabilities. Because of its focus on reporting, it earned low workload complexity scores (for example, reporting, static reporting and dashboards for smaller departmental deployments, the domain use case for LogiXML, are considered lighter analytic workloads than complex ad hoc analysis and interactive visualization for large and global deployments), it has some of the least complex deployments, and it is among the most limited in terms of breadth of functionality (the number of BI capabilities used). LogiXML added real-time OLAP capabilities for in-memory analysis in 2011 and plans to deliver an expanded set of interactive visualization and advanced analysis capabilities in 2012. The company is hopeful that this combination will result in expanded use of LogiXML for analysis and interactive visualization use cases in the future.

LogiXML's highly embeddable architecture is both a positive and a negative. On the one hand, this attribute makes it highly attractive to organizations embedding BI into existing operational applications and to OEMs looking to embed its product, an area where LogiXML has been successful to date. On the other hand, its high percentage of OEM business will limit its ability to expand brand awareness, as most users (and potential customers of the product) will never know they are using the company's product.

Although LogiXML has executed vertically focused marketing campaigns, targeted in particular at healthcare, manufacturing and financial services over the past year, and its OEM partners create vertical solutions using its platform, it has more limited, directly marketed packaged vertical offerings than many leading vendors. Moreover, its geographical presence, while growing outside North America (particularly in Western Europe and Asia, where the company has OEM, reseller and system integration partners) is more limited than for its larger competitors.

[Return to Top](#)

MICROSOFT

Strengths

Microsoft offers a competitive set of BI capabilities, packaging and pricing that appeal to Microsoft developers and its independent distributor channel. The company has consistently invested in building and enhancing BI capabilities into three of its core offerings — Microsoft Office (specifically Excel), Microsoft SQL Server and Microsoft SharePoint — in order to increase their value and drive upgrades. By incorporating BI capabilities into its most ubiquitous products, Microsoft virtually guarantees its BI offering's continued adoption, particularly in organizations with a Microsoft-centric information infrastructure. As a result of this strategy, since the company's serious entry into the market in 2000, Microsoft's BI market share has grown steadily to take the No. 3 spot in 2010.

Microsoft's low-license-cost bundling strategy for BI platforms makes it a compelling license-cost value proposition for organizations that want to deploy BI to a wider range of users, or that want to lower overall BI portfolio license costs by using lower-cost BI tools for basic BI functions. Its license cost profile is comparable to open-source BI vendors, and is considerably less than its commercial competitors. Moreover, Microsoft has added a new BI package (server/client access license [CAL] model) for SQL Server 2012, which makes it easier for customers to license the SQL Server BI portion of the stack. As Microsoft continues to enhance its BI capabilities in products that most companies already own (Office, SQL Server and SharePoint), the functionality premium for alternatives may become increasingly difficult to justify for many organizations. In the Magic Quadrant customer survey, more Microsoft customers cited TCO and license cost as the No. 1 reason for selecting Microsoft as a BI vendor than for most other vendors in the survey.

Microsoft's market success is also driven in part by its IT-oriented, BI authoring tools within SQL Server, which are based on Visual Studio, the broadly adopted development environment. This approach, along with targeted marketing efforts and programs for building strong developer communities and support, has helped Microsoft lower the cost and expand the availability of its BI skills. In the Magic Quadrant survey, Microsoft customers rate its BI platform infrastructure among the highest compared to most other vendors, and a higher percentage of customers use it extensively. Moreover, "wide availability of skills" is among the top reasons why customers select Microsoft more often than all other competing vendors in the survey.

While Microsoft has traditionally focused on the developer, it continues to enhance reporting, dashboarding and data discovery capabilities in Excel with the intention of making Excel not only the most widely deployed BI tool, but also the most functional for business users. With its April 2010 release of SQL Server PowerPivot and the upcoming release of Power View in SQL Server 2012, Microsoft has earned the distinction of being the first megavendor to offer a credible response to the groundswell of interest in, and acceptance of, interactive visualization tools as an alternative and complement to traditional report-centric architectures. Compared to what is available with competing stand-alone data discovery products, the user and usage monitoring capabilities of PowerPivot workbooks in SharePoint give IT greater control over what content is shared, and the process of validating data sources, models and calculations contained in PowerPivot workbooks. With the SQL Server 2012 release, Microsoft is expected to build on this set of managed business user capabilities by enabling PowerPivot to move seamlessly from a personal workbook to an enterprise data source and deployment. Specifically, IT will be able to import user-created content from a personal PowerPivot model into the professional BI environment of Visual Studio. This capability can help to bridge the departmental silo/enterprise divide, without compromising on business-user flexibility.

Use of OLAP functionality by Microsoft customers is among the highest when compared to other vendors. This can be attributed to the success and adoption of Microsoft SQL Server Analysis Services functionality bundled with Microsoft SQL Server and its optimizations with Microsoft front-end tools. Building on the in-memory capabilities of SQL Server PowerPivot, in SQL Server 2012 Microsoft will introduce a fully in-memory version of Microsoft Analysis Services cubes that enables the subsecond analysis of billions of rows (as opposed to hundreds of millions of rows supported today by PowerPivot), to address the needs of organizations that are turning to newer in-memory OLAP architectures over traditional multidimensional OLAP architectures to support dynamic and interactive analysis of large datasets.

Microsoft's cloud-based DataMarket offering, which makes external data easier to consume, analyze and integrate with internal data, is a unique enhancement to Microsoft's portfolio of BI capabilities. DataMarket is an online data market that enables ISVs to build new analytic applications. Business users can incorporate and analyze this external data with internal data sources using

Microsoft Excel and PowerPivot, or with partner tools, such as those from Tableau Software.

Cautions

Since Gartner began surveying BI platform customers for this Magic Quadrant research five years ago, this is the first year that Microsoft has scored below the survey average on key Ability to Execute measures, including overall product functionality, support and customer experience. These results are reflected in Microsoft's lower relative Ability to Execute position on the Magic Quadrant compared to last year.

Multiproduct complexity is a challenge. Because Microsoft's BI platform capabilities exist across three different tools (Office, SQL Server and SharePoint) that also perform non-BI functions, integrating the necessary components and building the applications left to the organization. Microsoft's do-it-yourself approach puts more of the BI solutions development and integration onus for platform components on customers, compared with the all-in-one purpose-built BI platforms offered by most other vendors in the BI market. Microsoft's road map for Office, which features the consolidation of more and more front-end reporting, dashboard and analysis capabilities in Excel, should begin to address some of this complexity over time. Moreover, although BI in the cloud is not yet a high priority for most organizations in the Magic Quadrant survey, Microsoft has placed cloud deployment at the top of its list of major development and go-to-market initiatives for BI by ultimately making its core BI products — SQL Server, SharePoint and Office — available in the cloud. This investment and emphasis is core to Microsoft's strategy to make BI easy to deploy and low-cost — cloud-based BI will, in theory, remove some of the complexity of the three-component requirement.

Microsoft lags behind most other BI vendors in delivering mobile BI capabilities. It has, instead, relied on partners, such as Decisio Support Panel, Roambi and Extended Results, to build mobile solutions for Apple iOS that integrate with Microsoft BI component. Microsoft BI assets can run in a browser today, but they are not optimized for iOS, Android or Windows devices. Microsoft has stated that it plans to optimize browser experiences on mobile devices in the future, including the version of Safari provided by iPad. It is notable that despite limitations to Microsoft's current mobile BI capability, an above average percentage of Microsoft BI customers report that they plan to deploy a mobile BI solution in the next 12 months.

Microsoft discontinued the development of Microsoft Office PerformancePoint Server 2007 (PPS 2007) as a stand-alone solution for financial analytic applications (for example, planning, budgeting and consolidation) in favor of moving its CPM capabilities, such as financial reporting, into the Dynamics applications. Microsoft moved the functionality in PPS 2007 for dashboards, scorecards and analysis natively into SharePoint as SharePoint 2010 PerformancePoint Services. As a result, Microsoft's performance management product strategy lags behind that of the other stack vendors (IBM, Oracle and SAP) that offer stand-alone CPM products. Microsoft instead relies on its partners to deliver Microsoft-based CPM solutions.

There is currently no single business metadata layer or capability that spans Microsoft's BI platform components, and there are limited capabilities for sophisticated metadata modeling, impact analysis, data lineage and change management. In Gartner's BI platform customer surveys, Microsoft scores below average year after year for its metadata capabilities. This year is no different. Microsoft earned among the lowest semantic layer integration and metadata functional rating scores of any vendor. The lack of a unified semantic model has been a key customer pain point and limitation. In response, Microsoft will be shipping the BI semantic model as the single business metadata layer, in the SQL Server 2012 release for relational and multidimensional data, and is adding data lineage, impact analysis and master data services in SQL Server 2012. As customers upgrade, we would expect the results to improve in next year's Magic Quadrant survey.

Microsoft's recent announcement to support Hadoop on Windows is a signal that it has plans to support diverse data types. However, unlike Oracle and IBM, beyond Hadoop, even though Microsoft has Bing, its core search engine, and FAST, its enterprise search engine in SharePoint 2010, Microsoft has not articulated a comprehensive vision around delivering analytics for diverse data. At the time of the FAST acquisition, however, FAST was gaining some traction with its BI search capabilities.

[Return to Top](#)

MICROSTRATEGY

Strengths

MicroStrategy specializes in enterprise BI deployments running on top of large enterprise data warehouses. Its customers cite functionality, performance and support for large data volumes as top reasons for selecting it as a vendor, more frequently than customers of most other vendors. Its deployments are among the most complex in terms of large numbers of users, the highest data volume, broad product functionality use, wide deployment across an enterprise, and complexity of analytic workload, and its customers have a high level of satisfaction with product functionality. Moreover, MicroStrategy is typically deployed in larger enterprises that consider it their enterprise BI standard more often than for most other vendors.

MicroStrategy has a focused vision that maps to key high-value market requirements, particularly for mobility, and large and diverse data, including social media data sources. The company was one of the first vendors to invest heavily in deploying BI applications on mobile devices, with earlier successes than its competitors in accumulating a respectable number of large production mobile deployments, initially on Research In Motion (RIM) BlackBerry devices and now on the Apple iPhone and iPad and Android devices. Free trials and online training make it easy for developers to try and succeed with mobile development. This early investment is beginning to pay off. In 2011, the MicroStrategy mobile application was one of the top-rated business applications on the Apple iStore. Magic Quadrant survey results show that MicroStrategy has among the highest percentage of customers using its mobile capability, with customers rating its mobile functionality among the highest of all vendors in the survey. Moreover, MicroStrategy has among the highest percentage of customers that are either using or piloting mobile BI (more than twice the survey average). Beyond mobility, MicroStrategy continues to reinforce its enterprise-scale pedigree through initiatives for high performance across all layers of its platform and against extremely large and diverse datasets (for example, support of Hadoop). MicroStrategy has invested heavily in creating a cloud offering that includes its platform and complementary technologies, including ETL and data warehousing. MicroStrategy is positioning its cloud offering as a way to address variable scale requirements, and lower TCO. Social data is another forward-looking area of focus for MicroStrategy. This past year, the company delivered a Facebook connector to enable organizations to integrate Facebook profile data, with user permissions, into a MicroStrategy analytic application.

Developer productivity for building complex analytic applications is another of MicroStrategy's strengths. Its efficient, parameterized report development paradigm and object-oriented report development environment support centralized management, in which a small number of administrators can support big BI projects with many users, complex reporting and analysis requirements, and large amount of data. With an extensive library of prebuilt objects, including metrics, prompts, filters and statistical functions, developers can create reports and other analytic content with high degrees of formatting and analytical sophistication, but with less effort and cost than many other platforms. With each release the company continues to streamline developer and modeling

activities and enhance proactive tools for managing and supporting MicroStrategy deployments.

In March 2011, MicroStrategy introduced a data discovery capability, Visual Insight, that complements and fully integrates with its enterprise, report-centric architecture. Visual Insight is available as a feature of Report Services, MicroStrategy's core product, reducing the need for most MicroStrategy customers to purchase stand-alone interactive visualization/data discovery products. Visual Insight is also available in a free personal cloud-based version. These efforts not only make it easier for a broader set of business users and workgroups to use MicroStrategy, they also provide capabilities for promoting business-user-authored models (that may include local data sources, such as Microsoft Excel) to the corporate metadata repository to minimize departmental silos, an advantage over stand-alone data discovery tools.

MicroStrategy has built its BI platform from the ground up through completely organic development. The high level of integration of the individual platform components and the reusability of MicroStrategy's well architected and object-oriented semantic layer are the result of this strategy, which is reflected in integration scores for MicroStrategy that are among the highest of any vendor in the Magic Quadrant survey. Without the integration challenges faced by the megavendors, MicroStrategy has more development cycles available for innovation.

Cautions

While the MicroStrategy development environment is robust and flexible, there is a steep learning curve, even for seasoned report developers building any level of analytic complexity into parameterized reports that simulate ad hoc analysis and interactive dashboards for business users. The need for interactivity beyond parameterized reports and dashboards will only increase with broader mobile BI application user adoption. Even though usability enhancements were delivered with MicroStrategy 9.x, such as more one-click user actions, reusable dashboards and dashboard design wizards, and although MicroStrategy delivered Visual Insight this past year, its customers continue to rate the platform below average for ease of use. We would expect MicroStrategy's ease of use assessment to improve as more MicroStrategy users take advantage of its mobile and Visual Insight interactive visualization capabilities.

Even though MicroStrategy has comparatively moderate administration costs per user compared to its competitors, its customer report above average license and implementation costs per user. Moreover, "cost of software" is cited by its customers as the top product limitation to broader deployment, more frequently than for most other vendors in this year's Magic Quadrant survey. In 2009, MicroStrategy introduced a fully featured and capable free version, which is upwardly compatible with new departmental and enterprise pricing packages. In addition, it made a portfolio of free online training available to make it more attractive and easier to adopt MicroStrategy outside the high-end enterprise market. Moreover, in 2011, MicroStrategy introduced MicroStrategy Mobile Suite, which allows anyone to build mobile BI applications at no cost. Despite these initiatives, plus its new free personal cloud data discovery offering, the cost, complexity of analysis and large enterprise attributes of most MicroStrategy deployments continue to reinforce its high-cost image.

While MicroStrategy Mobile, its new social data capabilities and its personal cloud offering will increase its appeal to business users and line of business owners, the company currently sells predominantly to IT, which has a stack-centric buying tendency. Megavendors offering end-to-end BI, CPM, packaged analytic applications and integration middleware optimized for their specific enterprise applications and technology stacks are at an advantage over MicroStrategy when stack optimization is an important purchasing criterion. MicroStrategy's focus on BI platforms excludes it from consideration, particularly in enterprise BI standardization projects where buyers are looking for single-stack optimizations with the existing information and application infrastructure. Moreover, MicroStrategy will have to strengthen its sales and marketing capabilities for business users and line of business owners in order to fully realize the potential of its mobile, data discovery and cloud offerings.

While MicroStrategy has added OEM relationships, with particular success among SaaS vendors, and it is continuing to develop partnerships to deliver industry-specific solutions leveraging its strong product vision, its geographic presence and packaged analytic applications (starter kits) continue to be more limited, both in number and geography, particularly in emerging markets, than those of other leading BI platforms. The continued expansion of MicroStrategy's services group and a renewed focus on system integration partnerships will not only help to minimize skill deficit barriers for MicroStrategy products, but will also enable it to deliver more industry-specific, advanced analytic applications based on its platform.

[Return to Top](#)

ORACLE

Strengths

In 2011, Oracle Business Intelligence Foundation Suite, with its principal component Oracle Business Intelligence Enterprise Edition (OBIEE), continued to execute on its stated top-to-bottom BI vision. This year, the products have the highest aggregate Ability to Execute scores. References depict a customer base that is Oracle through and through — 85% run Oracle Database as their data warehouse, nearly 75% run Oracle Applications, and a majority utilizes Oracle Fusion Middleware. Oracle is deployed most broadly (in respect of global deployment) of any vendor in this Magic Quadrant, with average user populations nearing 3,000 and data volumes of more than 5 TB, and it is considered the BI standard for nearly 70% of firms surveyed. While complex workloads are below average, the breadth of use scores in the highest quartile.

During the Magic Quadrant evaluation process, Oracle announced and completed its acquisition of Endeca, a search-based provider of e-commerce and analytic capabilities. Customer surveys were conducted before the Endeca acquisition was complete; therefore, Endeca is not factored into the Magic Quadrant evaluation of Oracle's execution, but was considered as part of its long-term product vision. Relatively low numbers of existing references access hybrid data types using OBIEE. Gartner believes that this is a forward-looking acquisition that will have significant impact on the company's business analytics future (see "Endeca Buy Extends Oracle's Ability to Support and Discover Diverse Data" for a more detailed opinion of the acquisition).

In October 2011, the company announced an engineered system — Oracle Exalytics In-Memory Machine — that leveraged assets across the Oracle stack. The integrated hardware/software analytics solution features a package of OBIEE with new in-memory capabilities (based on Oracle's acquisition of TimesTen), optimized Oracle Essbase to support the range of traditional BI (reports, dashboards and analysis), and dynamic planning, what-if and scenario analysis, as well as interactive visualization and data discovery capabilities. The system is designed to support high-performance BI and performance management use cases with the intention of improving the performance, scale and speed of reporting, analysis and planning applications. It is now generally available.

References select Oracle primarily for functionality, enterprise application integration, and data access capabilities. Additionally, customers indicated that they valued the products' ability to support large numbers of users. Like other megavendors, the product

road map plays an important role in the evaluation process. Ease of use and cost do not factor significantly into the selection process.

Oracle Business Intelligence Applications (OBIA) are predefined analytic applications for horizontal business processes such as finance, procurement and sales analysis. Customers and prospects find this combination of analytic applications built using the OBIEE toolset appealing, with many buyers selecting both at evaluation time. Additionally, the company also delivers vertical-specific analytic data models for industries such as retail and financial services for IT buyers looking to establish a common data model standard as the foundation for analytics.

Cautions

References rate OBIEE as difficult to implement, with only SAS Institute considered more difficult. Also, the product was rated as having lower than average ease of use scores. As ease of use for both developers and end users takes on an even more important role in business analytic deployments and evaluations, Oracle must explicitly address these issues or risk being marginalized in user-driven projects. The company has been slow to respond to the data discovery trend. However, some functions are now available in the Exalytics In-Memory Machine, and the Endeca acquisition will add more capabilities in this important area.

Product functionality evaluation scores remain below average again this year, a trend that appeared in last year's report. Additionally, customer support and product quality issues are rated below the average (in the fourth and third quartiles respectively) for all vendors in this report. In fact, both support and product quality were also noted as issues that blocked further deployments within customer organizations. This represents a slip from last year's scores. While not huge red flag items now, they may become more problematic without dedicated company attention to address client concerns.

Oracle customers use the product mostly for static report viewing, parameterized reporting and scorecard capabilities, leading to below average user complexity ratings. Slightly more than 25% of customers Gartner surveyed for this report run the most current version of the BI suite, which is significantly below average for vendors in this analysis.

More than 10% of survey respondents indicate that they plan to discontinue, or are evaluating a discontinuation of, software use in the next three years — a relatively high response rate given responses from the prior year. This is above the average for all vendors in this research.

[Return to Top](#)

PANORAMA SOFTWARE

Strengths

Panorama's NovaView BI suite — the product evaluated by Panorama's customers in this survey — continues to be used primarily as a front end for OLAP databases — chiefly Microsoft SQL Server Analysis Services — via Multidimensional Expressions (MDX). Similar to last year, references ranked Panorama in the top quartile of vendors for OLAP and scorecard capabilities. Panorama's customers indicate that the vendor is used as the BI standard in more than 75% of firms surveyed — the highest of any vendor in this Magic Quadrant analysis.

In 2011, Panorama introduced a new product, Panorama Necto. This is an example of a collaborative BI solution that facilitates interaction around BI content in the Panorama Software BI platform. It also helps users streamline their analyses and learn from best practices through recommendations for additional relevant BI content and analysis, based on other users' past behavior and contextual analysis. While generally available, no clients provided survey feedback for this report. Direct conversations with initial users indicate strong satisfaction with Necto with a straightforward migration path; however, rollouts have been gradual as departments adapt to this new analysis paradigm. NovaView BI customers did note that collaboration was a weak link in the existing product; this should address that concern.

This year, the top reasons why customers choose Panorama software are functionality, ease of use for end users, performance and cost. References also rate the vendor in the top quartile for TCO and give Panorama above average ratings for platform integration capabilities. Overall customer and sales experience ratings are above average, a marked improvement from last year and contribute to better execution scores in this year's Magic Quadrant. Another area of improvement from last year to be noted is that Panorama's support ratings have improved year-over-year, and customers are now generally positive about the vendor's outlook and the continued success of Panorama's products within their organizations.

Cautions

Reference customers have flagged one major concern about the NovaView product. They have indicated that the suite is unreliable and/or unstable, flagging it more often than any other vendor in the Magic Quadrant. This contributes to below average product quality scores, and is also noted as the primary barrier preventing further deployment. In 2010, the company recognized that product and support issues were a concern and took action. While there has been noted improvement in some areas, there is still work to do on software quality.

In addition to the limitations of NovaView's collaboration capabilities noted above, references gave low scores to the product's interactive data visualization options. With data discovery and ease of use so important in purchase and expansion decisions, Panorama must take this criticism seriously or risk being marginalized, and possibly losing its BI standard designation within reference accounts.

The average tenure of customers responding to this survey was 5.1 years. More than 20% of them report that they plan to, or are considering, discontinuing their use of NovaView software within the next three years. This is troubling, as it is the highest ratio any vendor in the survey, albeit similar to last year's response. While there have been improvements in customer satisfaction this year, we see softness in longer-term vendor support. The company's decision to maintain two product lines — NovaView and Necto — may contribute to this response, as customers must consciously license a new product to adopt the Necto capabilities.

Microsoft's anticipated BI release in 2012 may also give customers other options in the future.

[Return to Top](#)

PENTAHO

Strengths

Pentaho makes its debut on the Magic Quadrant this year, although it participated in the customer survey last year. It provides comprehensive open-source BI platform composed of ETL, OLAP, reporting, dashboards, ad hoc analysis and data mining components, all managed from a central BI server deployed either on-premises or in the cloud, with end-user access via the Web or mobile devices such as the iPad.

Low license cost is central to Pentaho's value proposition. The No. 1 reason that customers choose Pentaho is for its perceived license cost and TCO, more often than for any other vendor in the Magic Quadrant survey. Pentaho's customers are also generally satisfied with their sales experience, which is an improvement on last year.

Pentaho's lightweight footprint, in which the complete platform can be deployed in a small environment on a laptop, or can be integrated into an existing scalable architecture such as a grid for much larger deployments, makes it very flexible in meeting a broad range of deployment requirements. Moreover, Pentaho is an embeddable platform, making it very attractive to ISVs and internal IT shops for embedded use cases, which now make up 35% of its business, to deploy both on-premises and in the cloud.

While open-source vendors, including Pentaho, tend to invest more heavily to achieve feature parity with the core BI functionality of commercial competitors rather than in innovation, Pentaho does have focused areas of forward-looking investment, on which it has been able to deliver quickly. In particular, Pentaho has integrated a data mining project into its BI platform (which its customers rate above average); it delivered ad hoc reporting for the iPad (in May 2010); and it was one of the first BI vendors to deliver capabilities for integrating its ETL and BI tools with Hadoop to support large and diverse data sources (in October 2010). In 2011, Pentaho expanded its native support for a wide range of Hadoop distributions, NoSQL databases and analytics database (in August 2011), and added support for lightweight virtualized data federation (in June 2011).

Cautions

Pentaho's below average aggregate product scores (with below average ratings in all 14 BI capabilities with the exception of predictive modeling), although higher than last year, are still an indication that functional gaps in the platform remain. Moreover, Pentaho earned lower ease of use scores (both for developers and end users) than the survey average, which suggests that Pentaho needs to continue to improve on both its business user tools, to meet growing requirements for intuitive and interactive analysis, and the usability and efficiency of its developer-oriented tools. Moreover, ease of use goes hand in hand with the effort to develop content. Despite the perception of low TCO as a primary reason for purchasing Pentaho, users report among the longest BI content development times of all vendors in the Magic Quadrant survey. However, Pentaho continues to make investments in this area, with the June 2011 introduction of new and enhanced user-driven BI content development capabilities all thin-client designers for reporting, analysis and dashboards. Since only 23% of Pentaho's customer references (this is lower than only one other vendor) report being on the latest product release, as more customers upgrade we would expect its functionality and ease of use scores to continue to improve in next year's survey.

Given that Pentaho's subscription-based model hinges on providing superior support, and while we do see positive improvement on last year's survey, Pentaho's below average product support scores (particularly related to level of expertise) are a concern, especially since the company's product is also rated below average in terms of product quality, which tends to result in more customer interaction with support. Lower support scores could in part be explained by growing pains from Pentaho's rapid customer growth. During 2011, Pentaho put in place a number of changes to mature its support and services organization to support its growth, including hiring customer success managers, expanding the size of its support group, up-skilling its support team, and separating its escalation teams into two tiers in an effort to improve the customer support experience. Pentaho also created an OEM Development Services Group to address the customized needs of services and support for OEMs. Given that Pentaho has had some positive movement in its customer experience, product and support survey scores over last year's survey we would expect to see continued improvements as Pentaho's investments in improving support mature and its customer base upgrades to its newest releases. However, this remains to be seen. Counter-intuitively, despite Pentaho's below average score on most of the major customer experience measures, its customers have a positive view of the vendor's future. One explanation is that the value organizations derive from Pentaho's lower-cost deployments is in line with their level of investment and expectations.

Although Pentaho claims a single unified platform managed from a single server, the repositories and authoring environments remain separate, with migration to a single repository in process. Customers in the Magic Quadrant survey rate Pentaho among the lowest for platform integration of any vendor in the survey. To address this issue, in March 2010 Pentaho released a single environment for dimensional modeling, data mart building, ETL, OLAP model generation, and reporting and data analysis/visualization. We would expect customer perception of the level of integration (like functionality and ease of use noted above) of the Pentaho BI platform to improve as more customers upgrade to the latest release.

While Pentaho has some very large reference customers, Pentaho deployments still tend to be primarily departmental. Its customers have among the least complex deployments, which are roughly one eighth the size of the survey average in terms of number of end users and data volumes, while a majority of its customers (below the survey average) do not consider it their BI standard. One reason why Pentaho's references could be smaller may be due to its "try and buy" sales strategy, whereby deployments start small and grow. Pentaho has a large percentage of newer customers. Since this is Pentaho's first year on the Magic Quadrant, if customers are successful with Pentaho we would expect our survey data to show growth in the size and pervasiveness of Pentaho deployments in future years.

Pentaho recently received an infusion of venture funding, and expanded its already experienced management team with executives with a strong track record of success. Moreover, Pentaho's large active community, with 30,000+ members, provides outsized development resources that make many meaningful contributions to features, quality assurance, documentation, and road map requirements. This community gives Pentaho access to resources beyond what might be expected for a company of its size. However, even with its extended resources, Pentaho is small relative to the leaders in this space, with fewer resources to both enhance its core BI platform so that it is on a par with commercial equivalents, and to differentiate itself through innovation. Moreover, its vertical strategy and global reach for its commercial product are more limited than most of its larger commercial competitors.

[Return to Top](#)

PROGNOZ

Strengths

A new entrant to the 2012 BI platforms Magic Quadrant, Prognosis was founded in 1991 in Perm, Russia, with regional operations in Moscow, Brussels, Beijing and Washington, DC. Its product, Prognosis 5 Platform, is a unified BI platform with analysis, reporting, OLAP, dashboarding, modeling and predictive analytic capabilities. The company largely develops specific analytic applications or

consulting basis with its clients. Eventually, those applications are extended and new applications built by client organizations. Prognost's references rate the company the highest of all vendors in this Magic Quadrant for customer experience, and near the top for overall sales experience. The company's consultative approach is obviously well received. With hundreds of development resources available in Russia, the company is exceptionally responsive to customer requirements.

Customers choose Prognost most often for its functionality, skills availability (again, company consultants), and information infrastructure integration. The advanced statistical and analytic breadth of the product is a foundational element and at the core of the company's DNA. It is certainly evident when reviewing the platform and resulting applications built for customers. The product received first quartile scores in both complexity and breadth of use. References have a very positive outlook for the vendor.

With expertise in many sectors — government ministries, non-government organizations (NGOs) such as the International Monetary Fund and the World Bank, agriculture and manufacturing — Prognost has good credentials to support many industry-driven use cases. References report that many Prognost applications are built as externally facing applications — in fact, the highest percentage reported in this Magic Quadrant analysis — with lots of external content. Given the company's experience in government ministries and NGOs, it wasn't a surprise that these applications were used by external customers/constituents.

Cautions

Prognost's consulting-led approach, while a benefit to some, does significantly limit it as a free-standing, customer-implemented platform. The company has made strides recently in building out functionality to make the tool more approachable to client BI developers, but existing customers consistently report that ease of use for developers is a nagging concern. In Gartner's opinion this is the company's main challenge to competing in the BI platforms market.

Today, Prognost is deployed to an average of several hundred users at each account, below the average for all vendors in this survey, but still a respectable number. References report that expansion is often blocked when there is limited buy-in to an enterprise approach to business analytics. Conversations with references indicate that the product may be purchased and deployed for a specific use case — for example, econometric analysis — but not for general business use.

While Prognost has established a global footprint in major geographic regions of the world, it is in its early stages. Local capability is expanding as opportunities are closed, but there remains a high dependence on resources from headquarters to support local projects. It will take time for the company to replicate the success in its home market in other geographies.

[Return to Top](#)

QLIKTECH

Strengths

QlikTech is a marketing juggernaut; it has brand recognition many times more prominent than a firm with its current market share would expect. The company continues to be featured in a high number of Gartner inquiries and evaluations, which reinforces just how strong its momentum is.

QlikTech's QlikView product is a self-contained BI platform, based on a wholly in-memory data store, with a set of well-integrated BI tools. Anecdotal feedback from QlikView's end users invariably centers on how intuitive and likable the product is to use: 68% of customers surveyed selected it due to its ease of use for end users — higher than for any other vendor on the Magic Quadrant.

Based on the survey, QlikView deployments have grown over the past two years, both in terms of their reach across their customers (most QlikView implementations are regional or national, with the third widest scope of any vendor on the Magic Quadrant — only trailing Oracle and SAP), and in terms of the average number of users per customer respondent (a mean of 92 end users, still below the survey's overall average). Furthermore, QlikTech is building out from its initial midmarket stronghold; survey data shows that larger organizations are adopting QlikView.

Gartner frequently sees companies deploy QlikView for prototyping and requirements gathering, leveraging its flexibility to engage end users, usually alongside a more traditionally modeled BI platform — QlikTech's customers indicate that it is often used alongside SAP and IBM. This adoption model may explain why only 45% of its customers consider QlikView their BI standard — the lowest of any vendor rated as a Leader in this Magic Quadrant.

QlikTech's customers report strong delivery of business benefits, particularly in making better information available to more users and expanding the type of analysis undertaken.

Customers' rating of QlikView's functionality is very positive, in the highest quartile and above average in nine out of 14 functional capabilities: dashboards, interactive visualization, mobile BI, search-based BI, scorecards, ad hoc query, Microsoft Office integration, OLAP, and development tools.

QlikTech has the momentum to be a truly global player, with strong geographic expansion. This is evident from the customers that completed the Magic Quadrant survey in late 2011. It's already firmly established in Europe (it originated in Sweden), and is aggressively pursuing growth in North America. Uniquely among the vendors surveyed, however, QlikTech had almost a third (32%) of respondents coming from the Middle East and Africa.

Cautions

QlikTech's growing pains are more evident. The note of realism that first appeared in 2010 grew in 2011 and became a genuine concern for 2012. For the first time, QlikTech's customers reported having a poor overall customer experience (of the vendors on the Magic Quadrant only SAP, IBM, Targit and Microsoft fared worse), and below average ratings for product quality and support. Furthermore, more QlikTech customers than for any other vendor (with the exception of Oracle) said that QlikView became less successful in the previous year (that is, the product is being used by fewer users, or is being replaced by other tools).

Gartner continues to hear rumblings of discontent from QlikTech customers about the structure of its pricing model and its high license cost. Despite its strong market position and compelling value proposition, it is likely to be increasingly difficult for QlikTech to defend its premium price position as competition grows.

QlikTech faces increasing competition from larger BI vendors offering in-memory offerings and interactive visualization (particularly Microsoft SQL Server PowerPivot/Power View and MicroStrategy Visual Insight), all of which are intent on narrowing QlikView's opportunities for expansion by offering cheaper alternatives.

QlikTech offers limited metadata management. As QlikView grows into larger BI deployments spanning the enterprise, the lack of an enterprise semantic layer becomes a more pressing issue. Filling this gap requires additional cost and effort in the management of metadata to lockdown common definitions and calculations, and to conform dimensions for cross-functional analysis across

QlikView applications. Customers rate its semantic layer capabilities in the lowest quartile.

Although quick to develop simple or moderately complex dashboards, when it comes to building large, complex reports from various data sources, involving detailed logic or calculations, QlikView users reported the second slowest turnaround time of a vendor on the Magic Quadrant (only Pentaho was worse). One of the key issues QlikTech needs to address is QlikView's weakness in data integration (currently requiring IT scripting), which contributes to this issue.

Although strong on most of the measures driving the Completeness of Vision placing, QlikTech's product vision is at best focused at worst limited, when compared with other leading vendors. This is in part dictated by frame of reference: QlikTech sees itself as playing in a different market category to traditional BI, which it calls "Business Discovery" (adapting the "data discovery" term coined by Gartner in 2007). As such it is likely to view a number of the criteria Gartner measures product vision by as irrelevant to it, given that they address broader BI needs.

[Return to Top](#)

SALIENT MANAGEMENT COMPANY

Strengths

As found in its first year on the Magic Quadrant in 2011, Salient's customers are very positive about the vendor. In the survey, Salient achieved a top-three ranking for customer support (support expertise, response time and time to resolution); it was among the top three vendors whose customers had encountered no problems with the software; and it garnered the single best rating for product quality.

Salient's in-memory-powered BI platform achieved the highest average rating for BI functionality of any vendor on the Magic Quadrant, with clearly above average scores in all functional areas except dashboarding.

Write-back and constraint-based modeling functionality is one of Salient's key strengths. The ability to perform scenario modeling and support planning type use cases is rare in in-memory BI products, which tend to focus on ad hoc "slice and dice" type interactions.

Processing speed is also a strong suit. Salient's underpinning in-memory technology (which it calls UXT) switches processing across an array of servers to deliver rapid performance while handling complex calculations (for example, key performance metrics, productivity metrics, price elasticity, allocations). No Salient customers reported performance problems, and more of its customers than for any other vendor cited performance as a reason for selecting it (50% vs. an average of 20.2%).

Salient's customers report more complex user activity than for many other vendors, with a higher proportion of users doing predictive analytics than for any other vendor. As a result, Salient has a more analytic user profile; 31% of Salient's users are power users/business analysts (the highest surveyed, compared with a 21% survey average).

Cautions

Salient is little known in the BI platforms market, pointing to a lack of effective marketing communications activity in the past. In response to this observation, Salient increased its investment in marketing in 2011, leading to much expanded above- and below-the-line communications activity, new staff, and new segment-oriented positioning and campaigns targeting retail, consumer products, healthcare and the public sector.

Lack of customer acquisition and growth is a concern. Although Salient's customers are among the most satisfied we surveyed, they are also among the oldest — the average tenure for the Salient customers surveyed is 6.4 years, and almost 40% have used the product for more than 10 years. Long tenure comes with customer satisfaction, but it may also indicate an aging installed base and a firm facing difficulty acquiring new customers.

Despite its customers' across-the-board plaudits, Salient's functionality is narrower than that of traditional players, in that it does not offer a full set of BI capabilities — lacking production reporting and ad hoc query capabilities against SQL or MDX sources, for example.

A weak partner ecosystem is another concern. Salient needs to grow its indirect partner channel if it intends to step away from a high-touch approach, as this limits its growth. High-touch models do not scale rapidly, as staffing constraints are often encountered.

The company has no direct international presence. Although Salient's software is deployed internationally, it is not well represented outside the U.S. It has no direct operations other than its headquarters in New York state. Representation and support internationally is delivered via a small network of boutique partners in Malaysia, Japan, Brazil and Cyprus.

[Return to Top](#)

SAP

Strengths

The combination of SAP BusinessObjects and SAP NetWeaver BW revenue accounts for the largest share of the BI platform market with both SAP platforms continuing to support large enterprise deployments (more than twice the average for both data size and number of users). Similarly, a higher percentage of SAP customers than for most other vendors in the Magic Quadrant survey cited "corporate standards" and "integration with enterprise applications" as among the top reasons why they chose SAP for BI.

SAP has one of the largest global direct sales, support, and channel and services ecosystems. Moreover, the combination of SAP and BusinessObjects constitutes the largest installed base in the BI platforms market, which represents a significant and captive cross-sell and upsell market opportunity for SAP. SAP's product investments and road map are targeted at both the independent market and the SAP-centered market. Those product efforts that targeted the SAP base (particularly for SAP BusinessObjects BI 4.0 and HANA), when coupled with aggressive bundling and pricing, have resulted in strong product sales. Last year, 36% of SAP BusinessObjects customers in the survey reported having SAP as their primary ERP platform. In this year's survey, that percentage has increased to 42%.

SAP has a compelling and comprehensive product vision that addresses many key future trends including mobile, collaborative analytics, and analytics on big data. SAP complements its BI platform with forward-looking capabilities in the areas of collaboration and decision support (with its StreamWork product), text analysis integrated with its enterprise information management product and search-based data exploration with its SAP BusinessObjects Explorer product. SAP's product vision for its in-memory computing platform, HANA, promises to solve many of the perennial performance issues of large complex BI deployments in general.

(given its SQL and MDX access for third-party tools) and SAP BW in particular (HANA for SAP BW is in ramp-up status as of November 2011). SAP was one of the first of the leading BI vendors to introduce a SaaS offering, BusinessObjects BI OnDemand. The company has also made investments in mobile BI, leveraging assets from its Sybase acquisition into capabilities in SAP BusinessObjects BI 4.0 that deliver SAP BusinessObjects Explorer and SAP BusinessObjects Web Intelligence as a mobile application on multiple device platforms. However, there are many pieces to this vision. Clarity around the road map, demonstration of the value proposition, and execution will be critical to customer uptake and overall satisfaction with SAP.

SAP is investing in industry- and domain-specific packaged applications built with SAP BusinessObjects that include a data mode ETL and business content. Although uptake of these applications is in the early stages, SAP has moved to optimize a number of these packaged applications for SAP HANA, and plans to port more of these applications to HANA throughout 2012. This could enhance the value proposition of the HANA platform beyond its capabilities for performance acceleration.

Cautions

Customer inquiries with Gartner analysts about SAP BusinessObjects continue to express confusion about the BusinessObjects, SAP BW and HANA road maps, given the product changes to support optimizations with the SAP business applications and NetWeaver BW products, and the perceived unknown costs of migrating to the new road map. These customers have also told that the migration, implementation and integration choices can be confusing. These sentiments are supported by survey responses to the "view of vendor's future" question, which indicates that twice as many of the SAP respondents (compared with the survey average) indicated that they are "more concerned" about the vendor's future. Many SAP NetWeaver BW customers and SAP BusinessObjects customers are still determining what role these products will play in their future architecture and BI strategy. This uncertainty may also be contributing to the sentiment that SAP is among the top three vendors whose software customers are thinking about discontinuing, a percentage that is almost three times the survey average.

This is the fifth year in a row that our market survey data shows ratings for SAP's customer experience (which includes ratings for support and software quality and for sales experience) as the lowest of any vendor in the survey. That said, SAP is building on last year's customer success initiatives, by stepping up its efforts to work with Americas' SAP Users' Group for customer input, and it has increased investments in programs to redesign the SAP support process to address customer issues, and to address the customer experience more broadly.

While SAP's customers tend to have very large and global deployments, poor performance is mentioned twice as frequently as the survey average as a problem limiting broader deployment, while direct performance scores are among the lowest in the survey. This problem is more acute for SAP BW customers than for SAP BusinessObjects, but both products score near the bottom of the survey on this measure. Both SAP and SAP customers alike are hoping that SAP HANA can address this problem. Early adopters of HANA SP1 and SP2 (HANA on SAP BW) have reported positive experiences in this regard.

Both SAP BusinessObjects and SAP BW scored below average, when compared to other vendors in the survey, across all 14 BI platform capabilities evaluated during the Magic Quadrant research process. Of those capabilities, SAP BusinessObjects' custom identified reporting and ad hoc query functionality as the platform's top strength. SAP BI 4.0, made generally available at the time of this year's Magic Quadrant survey data collection and therefore not included in the survey responses, is expected to provide significant number of feature and usability enhancements, in addition to improved integration with SAP BW. As more SAP BusinessObjects customers upgrade to this latest version, we would expect to see better product scores reported in next year's Magic Quadrant.

At the end of August 2011, SAP implemented its third license model change (Concurrent Session-Based Licenses [CSBLs] and Named User licenses) for SAP BusinessObjects since the Business Objects acquisition in January 2008. While there are many advantages for users in using CSBL, changing license models have contributed to confusion, and concern. Also, some customers are charged for upgrades when they expected to be provided with product at no/low cost — for example, SAP BEx Analyzer customers expecting to move to SAP BusinessObjects Analysis for Microsoft Office.

[Return to Top](#)

SAS

Strengths

SAS gets high marks for its global footprint and broad industry initiatives. Unlike some other BI platform vendors, SAS focuses on advanced analytical techniques, such as data mining and predictive modeling, where references acknowledge it as a leader of the pack. SAS's clients also have above average complexity scores (for the depth of use of different BI use cases) on larger than average data sources. SAS customers also access and interpret unstructured internal and external data more often than any other vendor's clients surveyed for this Magic Quadrant.

SAS's solution-oriented analytic application approach to the market is a differentiator, giving the company the advantage of having a wide variety of cross-functional and vertically specific analytic applications out of the box for a variety of industries, including financial services, life sciences and manufacturing. While others are also adopting this approach, SAS remains in the lead. Customers also report an above average sales experience.

The primary drivers for customers choosing SAS remain functionality and data integration. In addition, references reported that they select SAS because of availability of skills. In the past, we have heard concerns over a lack of available SAS expertise; we suspect that this improvement is linked to the aggressive stance the company has taken to forge substantial partnerships with services firms, specifically Accenture. This broadened ecosystem also expands SAS' sales channels with multiple partners positioning SAS-based solutions to their customers.

On the software partnership front, SAS has partnered with a number of database vendors (such as Teradata) to push the execution of its models directly into the database management system without moving the data. Not only does this reduce data duplication and movement, it also allows SAS users to leverage the power and scalability features of the database to run predictive models against very large datasets with high performance.

Overall, SAS has a wide and loyal user base, many of whom have built careers around these products. References have a solid, positive outlook for SAS's success within their organizations, as well as in the market as a whole. The company recently reported double-digit revenue growth for 2011.

Cautions

References report that SAS is very difficult to implement — it was the No. 1 firm in this category. Companies also indicate that the

product is considered difficult to use for business users (it was ranked No. 2 in this category). Its dashboard capabilities were rated lowest of all the vendors in this research. SAS is very much aware of these criticisms, and in 2011 embarked on a major development initiative involving hundreds of resources to improve usability and implementation activities. While it is too early to see the results of these efforts in surveys, we expect to see improvement in these areas in next year's reference assessment. If no improvement is noted, this will directly impact SAS's Ability to Execute scores for 2013.

SAS's dominance in predictive analytics and statistics continues to be challenged on many fronts. In addition to the SPSS suite, SAS also acquired Alghemics in 2011 to bolster its portfolio; we are seeing greater adoption of open-source "R" in some products, embedded predictive and statistical capabilities in others. New entrants to the BI platform Magic Quadrant Prognosis and Alteryx accentuate these capabilities as core components of their product suites. While SAS still remains the acknowledged front runner, buyers have more options now, and SAS must continue to defend its franchise. The company recognizes this and, for example, has reinvigorated its emphasis on placing its software products in higher education settings for student and teacher use.

Customer references report that cost is the most common factor blocking further adoption. In fact, verbatim responses to the survey mention cost in many ways — leasing terms, expensive to maintain, ongoing costs and so on — and, again, the company is very much aware of this criticism. With more options now available, SAS should also remain responsive to customers and prospects in these areas. The average tenure of SAS's reference customers that participated in this survey was five years. Over 10% reported that they are planning to replace or are considering replacing the software in the next three years.

Despite SAS's success and awareness as a leader in the predictive analytics space, the company is still challenged to make it or BI platform shortlist evaluations when predictive analytics is not a primary business requirement. While a little less than 60% of references indicated that SAS was their company's BI standard, functionality used in traditional BI areas (reporting, dashboards, OLAP and so on) was lower than for other BI leaders in this report. Like last year, ad hoc query remains the one exception, with clients aggressively using SAS BI for that component.

[Return to Top](#)

TABLEAU

Strengths

For the third year in a row, Tableau is the "sweetheart" of the Magic Quadrant, with customers even more enamored with it this year than in the last two. It gained overwhelmingly positive customer survey feedback across the board in all measures in the survey, including ease of use, functionality, product quality, product performance, support, customer relationship, success, achievement of business benefits and view of the vendor's future. Indeed, it earned a top or near top score in most of these key categories — even with its high revenue growth (94% in 2011), when growing pains might be expected. These stellar results in part contributed to Tableau's strong Ability to Execute position, despite its relatively small size.

Tableau is one of a number of stand-alone BI vendors delivering strong interactive visualization for analysis, dashboards, information delivery and managed analytic applications. Tableau's strong performance, even with an increasingly crowded competitive landscape, is evidence of its ability to meet the increased market demand for easy-to-use and intuitive interactive BI tools that are easy to deploy without IT assistance. Not only is Tableau benefiting from its "halo" image as a result of its strong performance in the Magic Quadrant customer surveys, it is also receiving collateral benefit from QlikTech's successful market awareness activities. In particular, most vendor selections that may start out with a primary interest in QlikTech also end up including Tableau as a competing alternative, with the win sometimes going to Tableau. Survey customers cited ease of use for end users and developers, and functionality, as the key reasons for choosing Tableau more often than those for most other vendors in the survey. Importantly, a higher percentage of Tableau's customers, compared with most other vendors, report that there are "no product issues to broader deployment," a key measure of satisfaction with customer experience.

Tableau's self-contained BI platform provides purpose-built, business-oriented data mashup ETL capabilities with data connectors that leverage Tableau's own VizQL technology (drag-and-drop operations in Tableau create a query in VizQL, which interprets a packages an SQL or MDX query to the database and then expresses the response graphically). Its columnar, in-memory data engine, which can be used as an alternative to its direct query access, enables fast performance on large and multisource datasets and on complex queries, such as very large multidimensional filters or complex co-occurrence or multipass queries. Zero programming data mashup capability, combined with an in-memory database, allows users to blend and visually analyze large amounts of diverse datasets with auto-detect relationships between multiple sources (of any format). This allows users to connect to any data source and produce a series of interactive dashboards, and highlight and visually filter and pass parameters directly from a graphic; or use filters (for example, check boxes, sliders, relative date filters and drop-down menus); or build in geographic intelligence to analyze their data. Interactive analysis can be shared with a report consumer equipped with a Web browser. The combination of exceptional ease of use ("fun" is often used to describe Tableau by its users), with the ability to conduct sophisticated analysis, is a key reason users are exuberant with the platform.

Customer survey data shows that Tableau is chosen most frequently by its customers for functionality, with among the highest overall product functionality scores, and just edging out Tibco Spotfire for the No. 1 spot (of vendors on the Magic Quadrant) for interactive visualization — Tableau's main strength. Moreover, its mobile capability is gaining traction, with an above average percentage of its users either using, piloting or planning to deploy its mobile capability. Those who use its mobile capability have very favorable, above average view of the functionality.

The size of the data that its customers analyze with Tableau continues to grow. In fact, Tableau's implementations continue to feature larger data sizes, including content (Hadoop, for example), which this year are among the highest data sizes and highest percentage of analytics on unstructured data in the Magic Quadrant survey. Moreover, Tableau has a growing percentage of external users accessing externally facing Tableau applications. This is, in large part, due to Tableau's SaaS offerings, Tableau Public and Tableau Digital, which have enabled websites (such as CBS Sports' Fantasy Football and Baseball, Microsoft's DataMarket and other news, media, entertainment and government websites that embed Tableau Public visualizations) to share data in engaging ways with their audiences. This high-leverage go-to-market approach also contributes to Tableau's strong market awareness, and has the potential to expose substantially more users to Tableau products (to further drive Tableau's momentum) than would its traditional direct channels.

Cautions

Tableau's product functionality is more narrowly defined around analysis and interactive visualization. It lacks broader BI platform capabilities, such as production reporting and predictive analytics. Tableau has introduced a shareable semantic layer — a key enterprise feature — in its 7.0 release (made available just prior to the publication of this year's Magic Quadrant), giving it a competitive advantage over QlikTech.

Although Tableau's user counts remain below the survey average (albeit growing from last year), it is still largely departmentally deployed with smaller user counts. Tableau's products often fill an unmet need in organizations that already have a BI standard and are frequently deployed as a complementary capability to an existing BI platform. Tableau is still less likely to be considered enterprise BI standard than the products of most other vendors.

Tableau's partner program, while expanding over last year, is still in its infancy, lagging behind that of similar vendors (such as QlikTech). But it continues to make progress, including outside North America, in increasing its resellers and OEM partners in the past year. As is not uncommon with a small vendor, Tableau is initially pursuing a horizontal platform strategy, and has not embarked on developing vertical or industry-specific applications, although it has a number of OEM partners that create domain and vertical solutions using its platform (for example, for healthcare, manufacturing and kindergarten through to twelfth-grade schooling). Moreover, it has a very limited international presence, and while the software is now available in English, German and French, support services are available in English only.

Given the success of Tableau and other interactive visualization vendors, other leading BI platform vendors including Microsoft, MicroStrategy and others, are trying to mimic its functionality, which could threaten Tableau's long-term prospects as an independent vendor.

[Return to Top](#)

TARGIT

Strengths

Target's intention is to make BI easier to use, with as few clicks as possible, and by far the strongest reason expressed by customers for selecting it is its ease of use for end users. Following the principle of "observe, orient, decide, act," the design of Target user interface delivers a consistent user experience, integrating components of the BI platform and so reducing the need to move between different tools.

The Target BI platform includes tools that help set up the environment with very little intervention. The platform does a significant amount of the setup automatically, ranging from scheduled report generation, drill-down and dashboarding to intelligent search alerting and some level of data mining. Target's customer organizations report that they are able to develop reports much more quickly than on average.

Target's prediction-based rules capability, called Sentinels, offers a means to support more complex analytic needs in organizations that may not have the skills to build out data mining models with other tools. This functionality is being rapidly taken up in Target user base, with a third of customers adopting it since its launch two years ago.

Based on the survey, Target is obviously attractive to those using Microsoft — 67% of its customers are using Microsoft as their primary ERP software provider and 88% for their primary data warehouse, much more than for any other vendor. It's notable that an above average proportion of Target customers say that its ability to integrate with their ERP applications was a reason for selecting it.

Target has developed a strong OEM channel, with CDC Software, HP and Microsoft among its resellers.

The company's cloud and collaboration vision is also a strength. In 2011, Target added facilities for end-user-deployed analytics by allowing users to upload data to the Target Cloud, which then automatically generates the best-fit visualization for further analysis of the data. Target Cloud also facilitates social networking and collaboration around the data uploaded.

Cautions

Target still has limited brand recognition or presence outside Europe. However, it is showing strong growth in the U.S.: 40% of those completing the survey regarding their use of Target originated in North America this year.

While Target is considered an enterprise standard by most of its customers, it is very much a midsize enterprise BI solution. On average, the smallest organizations surveyed use Target, on some of the smallest data volumes and with the smallest numbers of end users in the survey.

Target customers cited problems with poor performance at more than twice the survey average. In some cases this is due to slow responses from the repositories feeding it. However, Target is adding new functionality in 2012 in areas such as on-demand loading and real-time OLAP, and via the use of in-memory database technology to improve performance.

Ideally, for Target to function well, it requires a data warehouse with defined dimensions and measures — according to the survey just 4% of Target customers do not have a data warehouse. This has the effect of reinforcing Target's niche target market segment — there are relatively few small firms with high data warehouse maturity. As mentioned above, Target's cloud strategy may ameliorate this inhibitor by offering an alternative means of deployment.

References rated Target in the lowest quartile for BI functional capabilities. Target achieved above or close to average ratings in scorecards, ad hoc query, dashboards, OLAP and Microsoft Office integration in the survey, but was below average in all other functional capability areas.

Target's customers rated the support they receive as below average, with levels of expertise, response time and time to resolution in the bottom three of all vendors. Target's lack of a direct sales channel, and therefore its relationship with its customers, may exacerbate this type of issue in its client base, particularly in markets where it is growing quickly via its indirect channel. The company is aware of this issue and has put in place a new customer service department in the U.S. to deal directly with end customers and improve their customer experience, an approach it has found effective in Europe.

[Return to Top](#)

TIBCO SOFTWARE (SPOTFIRE)

Strengths

Tibco Spotfire is a flexible and easy to use data discovery platform based on an in-memory architecture for self-service discovery, authoring analytic apps, and publishing interactive and highly visual dashboards. Like QlikView and Tableau, Tibco Spotfire's interactive visualization approach has become more widely accepted, and even a preferred, end-user paradigm, and represents a compelling complement or alternative to traditional BI platforms. This architecture has been particularly attractive for delivering requirements where Tibco Spotfire fills a need not addressed by enterprise BI vendors. Customers choose Tibco Spotfire for its ease of use for end users and functionality more often than they do most other vendors, even though it is less likely to be their

enterprise standard.

Much like the other data discovery vendors that are addressing increasing market requirements for intuitive, highly interactive and lightweight BI platforms, Tibco Spotfire's customers are very satisfied with all aspects of the relationship. In fact, they rate it among the highest in the customer survey for support, customer experience, performance, positive view of vendor's future, vendor success, overall product functionality, sales experience and achievement of business benefits.

Survey customers rate Tibco Spotfire's overall functionality among the top for vendors in the survey. In particular, Tibco Spotfire customers give among the highest marks and report more extensive use for predictive analytics and interactive visualization than for most vendors in the survey, with above average scores for ad hoc query and analysis. Because of Tibco Spotfire's ease of use, more users can leverage the benefits of analytics.

Tibco Spotfire has among the highest complexity of user analysis score than any vendor on the Magic Quadrant, while at the same time customers rate it above average on ease of use, particularly for end users. This paradox typifies why data discovery tools in general, and Tibco Spotfire in particular, are so compelling and are proliferating.

Tibco Spotfire's strong product vision is a key strength. Its focus on advanced and real-time analytic applications and dashboards delivered to mobile devices contributes to its strong vision. Its investments in mobile are beginning to pay off, as Tibco received among the highest marks for its mobile functionality; among the highest percentage of users of any vendor in the Magic Quadrant survey are currently deploying its mobile capability. Unlike the other data discovery platforms (for example, QlikView and Tableau), Tibco Spotfire is leveraging its acquisition of Insightful for data mining, as well as its integration with Tibco middleware and Tibco social capability, Tibco, to broaden the possible spectrum of end-user-driven interactive analysis, to incorporate business events predictive analytics and "what if" modeling. Moreover, Tibco Spotfire's low-cost cloud version of its software allows business users to author and share Tibco Spotfire visualizations and dashboards without having to install the software on-premises.

Tibco Spotfire is well positioned to take advantage of the increase in market demand for packaged analytic applications and dashboards, which increasingly feature predictive analytics capabilities. A third of Tibco Spotfire's customers use one or more of specific packaged applications for life sciences, manufacturing, financial services, process analytics, spend analytics, and sales and marketing analysis.

Cautions

Even though the average employee size of a company that uses Tibco Spotfire software is the among the highest in the survey and although Tibco Spotfire has some customer references with extremely large datasets and thousands of users, on average its deployments tend to be focused on a department or multiple departments, with below average data volumes and numbers of end users when compared with those of other vendors. Tibco Spotfire also scored among the lowest of all vendors in the reference survey on the percentage of customers that consider it their BI platform standard. The combination of this result with Tibco Spotfire's strong functionality ratings suggests that, while it is not usually the enterprise standard, it has been successful in augmenting the BI standard when more flexible discovery-based and sophisticated analysis is required.

Tibco Spotfire is well suited to building analytic content ranging from basic interactive visualizations and dashboards to advanced interactive analytic applications, and its customers are very satisfied. But the perception of Tibco Spotfire's license cost and packaging continues to be a factor limiting its consideration beyond a restricted set of users with high-end requirements. While premium for Tibco Spotfire software may be justified given its differentiating features around collaborative, mobile, advanced and real-time analytics, Tibco Spotfire must overcome its high license cost reputation to capitalize on the significant buying momentum driving the growth of more mainstream and competitively priced and packaged data discovery alternatives. As further evidence of its high license cost reputation, like last year, license cost continues to be cited as a limitation to broader deployment more often than for most vendors in the survey, and its "total license cost per user" continues to be above the survey average. Tibco's above average pricing may, in part, be explained by the fact that 35% of its sales are from its analytic applications, which tend to be more expensive. Tibco's introduction of new pricing and packaging options in 2010, as well as the launch of a low-cost SaaS offering in mid-2010, are evidence of the company's efforts to combat this market perception, but the perception still remains in 2011. We would expect to see this change in the future, as Tibco delivers on its marketing and sales strategy.

Awareness of the Tibco Spotfire platform has been primarily limited to its traditional customer base — analysts and data scientists in industries such as pharmaceuticals, life sciences, financial services, energy and manufacturing. The survey data and Gartner inquiries continue to suggest that awareness of Tibco Spotfire for mainstream data discovery requirements is less than its primary competitors — QlikTech and Tableau — and it is not considered on shortlists as frequently to meet mainstream data discovery requirements. However, there is a significant opportunity for this to change, since this is a marketing investment priority rather than a product challenge. To capitalize on this opportunity, Tibco (the corporation) has stated that it views Tibco Spotfire as a key high growth area for the next several years, and that it has begun to invest in expanding Tibco Spotfire's awareness, sales, marketing and partner capabilities, all to capitalize on a much larger percentage of mainstream BI platform and data discovery market opportunities in 2012 than Tibco Spotfire has had in the past. For Tibco Spotfire to be considered a Leader in the future, it will need to execute successfully on these efforts by demonstrating larger and more pervasive deployments and stronger market awareness and shortlisting outside its traditional installed base of niche users.

While Tibco Spotfire is rated highly in the survey for ad hoc analysis, interactive visualization and predictive analytics, it is rated the bottom third of vendors for static and parameterized reporting, confirming that its true sweet spot is in providing a flexible, easy to use environment for advanced analysis.

[Return to Top](#)

Vendors Added or Dropped

We review and adjust our inclusion criteria for Magic Quadrants and MarketScopes as markets change. As a result of these adjustments, the mix of vendors in any Magic Quadrant or MarketScope may change over time. A vendor appearing in a Magic Quadrant or MarketScope one year and not the next does not necessarily indicate that we have changed our opinion of that vendor. This may be a reflection of a change in the market and, therefore, changed evaluation criteria, or a change of focus by a vendor.

[Return to Top](#)

VENDORS ADDED

Alteryx, Pentaho and Prognosis were added to this year's Magic Quadrant, as they were able to meet all inclusion criteria.

Other Vendors to Consider

Even though they did not meet the criteria for inclusion in the Magic Quadrant, the following vendors are benefiting from the growth the BI platforms market and may be worthy of consideration in BI evaluations.

Data Discovery

While three data discovery vendors (QlikTech, Tibco Software [Spotfire] and Tableau) had enough market adoption to earn a spot on the Magic Quadrant itself, there are a number of smaller vendors that could be considered when data discovery is a unique requirement. Three of these vendors, Endeca (acquired by Oracle in late 2011), Advizor Solutions and Quiterian, provided customer references with enough survey responses to be included in the Magic Quadrant customer survey research notes that will publish as complements to this research, but did not meet the revenue requirement to earn a place on the Magic Quadrant in its own right.

Gartner bifurcates the data discovery tool market into interactive visualization tools and search-based data discovery tools. All the vendors either on the Magic Quadrant itself or listed thus far in this section fall into the former category of vendors. Endeca, acquired by Oracle in December 2011, is one of the unique vendors that falls into the latter category. Founded in 1999 as an enterprise search vendor, Endeca is leveraging its search technology to renew its focus on the BI platform market. Its Latitude product combines the simplicity of a search interface and faceted browsing with the insight of BI by delivering interactive tools that support fast data exploration and discovery on top of its patented hybrid search-analytical database. With its unique platform, there is no need for an overarching data schema — every record and document has its own schema stored in a columnar store with text and data indices but in dedicated columns. As a result, the columnar architecture can support in-memory-grade performance without in-memory constraint. The data discovery mode is search-based, which enables navigation and analytics on both structured data and unstructured content making documents and Web-content part of searchable decision data. Every summary is also a way to query the data, letting users iteratively explore data and ultimately reach conclusions that drive decisions. The acquisition of Endeca helps Oracle appeal to enterprises that want to search, combine, analyze and integrate structured and unstructured data types to optimize decision making business processes and their online presence. In particular, the acquisition adds complementary search-based data discovery to Oracle's business analytics strategy, a capability Oracle lacked. The most notable positive potential from the acquisition is that Endeca will boost Oracle's "ease of use for end user" and "complexity of analysis performed" scores, areas which are among the highest for Endeca and below average for Oracle. When the Magic Quadrant process began in 3Q11, Endeca was an independent firm and provided references for this year's customer survey, but did not meet all inclusion criteria to get its own dot on the Magic Quadrant. Now, as part of Oracle, Endeca Latitude contributed positively to Oracle's Completeness of Vision scores. In next year's report, Endeca capabilities and customer responses will be fully reflected in Oracle's position on the Magic Quadrant.

Advizor Solutions offers an end-user data discovery and analysis product suite with an in-memory performance layer, descriptive and predictive analytics and a user interface built around a library of sophisticated interactive images. Advizor competes directly against likes of Tibco Software (Spotfire), Tableau and QlikTech, and maintains a long-standing OEM relationship with BI platform provider Information Builders, as well as other vendors supplying horizontal and/or vertical applications. Over 20 references responded for Advizor, and they paint a picture of the average customer: based in North America, largely in the higher education sector, using the products on relatively small amounts of data (approximately 100 GB), when compared to the average for all vendors, in small groups that average less than 40 in number. These customers select Advizor for four main reasons — functionality, ease of use for end user, data access and integration, and implementation cost and effort. The products get high marks for interactive visualization, and customers give the firm exceptional scores for support, sales experience and overall customer experience. The data discovery segment is expanding, with other existing BI platform providers delivering competitive products in 2011 and 2012. Advizor needs to expand its awareness to grab part of that buyer budget.

Quiterian, based in Spain, provides data discovery tools with predictive analytics, and allows business analysts to conduct "visual data mining" without relying on the specialized skills of a data scientist. Quiterian and its Dynamic Data Web (DDWeb) product were introduced to Gartner in 2010, but have been available in the company's home market since 2003, where the company has a good presence and reference base. Effectively a large-scale data discovery offering, its core value proposition is easing the use of data mining and statistical analysis, and thus making these capabilities more broadly available. However, this means it'll be up against stiff competition, notably from IBM (SPSS) and SAS (in particular JMP), as well as from Tibco Software (Spotfire), which offers a similar value proposition for complex data discovery and advanced analytics. Technically, DDWeb uses an intermediate processing layer on top of its own columnar database — Quiterian FastDB, released in 2011 — to enable BI functionality (for example, predictive analysis). Quiterian has been expanding its geographical reach, having opened offices in Portugal, Mexico and the U.S. in 2010, as well as through a growing international value-added reseller channel with 12 new partners in the U.S. and Canada, and other partners in the Asia/Pacific market.

Cloud/SaaS Business Intelligence and Analytics

SaaS remains a viable option for some buyers. Just 30% of respondents to the Magic Quadrant survey were currently using or had plans to use cloud-based BI and analytics within the next 12 months — a slight uptick from last year. The subcategory shows slow but steady momentum as a departmental, mid-market and/or analytic application approach to augment existing analytic capabilities and analyze data already in the cloud. Pure-play vendors such as 1010data, Birst, Domo, GoodData, myDials and PivotLink continue to compete aggressively for mind share and budget dollars. Cloud capabilities have emerged from traditional BI platform providers, with new capabilities regularly introduced over the past year.

1010data, headquartered in the U.S., has a different spin on cloud business analytics. By focusing on the challenges with "big data," the company cut its teeth in the financial services sector, working with one of the world's largest stock exchanges, analyzing detailed trade data. While focusing on complex, voluminous sources of data, it has also fostered a service to build out customer-driven analytic applications of that data, trademarking the phrase "the trillion row spreadsheet" to capture the breadth and scope of information analyzed on demand within the platform. Accordingly, references indicate that BI performance and ability to analyze large volumes of data are their primary reasons for selecting 1010data. Deployments average fewer than 200 users, but companies they sell to are some of the largest that responded to this Magic Quadrant survey. Customers also reported a high complexity of use cases (in the highest quartile of all vendors surveyed) with specific success in predictive capabilities within the platform; references indicated that difficulty of use was a concern blocking further deployments among a wider user community. The company has expanded its vertical focus to include telecommunications, and retail/consumer products goods where data volumes, performance and complex analysis are hallmark requirements.

U.S.-based Birst provides a SaaS-based end-to-end BI and data integration platform. In 2011, the company introduced an appliance option that allows companies to choose an on-premises or hybrid (mixed on-premises and cloud) deployment. With this addition, clients can choose to continue to license as a subscription or via a perpetual license/maintenance model. The company also recently made

available an in-memory data store option complementing its traditional supported commercial SQL databases. Birst supplies predefined analytic application templates for sales performance and pipeline analysis, as well as financial services/insurance industry application. Its reference clients indicate that it is used as the enterprise standard BI platform above the average for all vendors in this Magic Quadrant analysis; use cases are heavily skewed toward consumption only and casual scenarios, to hundreds of users, on average. Companies choose Birst based on functionality, implementation cost and effort, and data access and integration capabilities.

Launched in 2011, U.S.-based Domo is based on the assets acquired in October 2010 from Corda Technologies, a vendor of solutions for building dashboards, rated as a Niche Player in the 2011 BI Magic Quadrant report. Corda's 900 OEM customers will continue to be supported; however, no new functionality will be added to the legacy products. Enterprise customers, along with OEMs, will be encouraged to move to the new Domo offerings. Corda developer tools, PopChart and OptiMap, will continue to be sold. With the Corda brand retired, and \$43 million in funding, Domo is moving forward with an "executive management platform," and an attempt to solve the ease of use issues that some competitive BI solutions have. It is targeting executive-level users with dashboard and drill-down features that integrate information from across the variety of systems, such as ERP, CRM, HR and financials. This will be an interesting company to watch. The founders have a successful history of building specialized analytic applications and delivering them via SaaS, competing in the BI market, as primarily a SaaS vendor, will be more difficult, especially when trying to address unique requirements found across enterprises.

GoodData, founded in 2007 and headquartered in the U.S., has developed an end-to-end ETL, data warehouse and analytics PaaS capabilities used by more than 2,500 OEM customers and over 150 direct clients to develop and deploy metrics-driven dashboards. The vast majority of customers were new in 2011. The company also packages predefined SaaS applications for common content areas such as salesforce.com sales, marketing and support analytics, Google Analytics, and Zendesk help desk analytics. The suite delivers integration capabilities to source data from within and outside the enterprise. A few references responded on behalf of the company and those that did indicated that the top three reasons they selected GoodData were implementation cost and effort, ease of use for end users, and integration. The company received \$15 million in new funding in August 2011 to further its expansion.

Another interesting BI SaaS vendor is myDials, headquartered in the U.S. The company was founded in 2006 and delivers myDials Performance Management Platform, a Web-based, easy-to use, highly interactive dashboarding system. The platform features built-in business-user-oriented statistical capabilities for identifying trends, forecasts with error ranges, and patterns with support for drilling into the data while context is maintained, to identify the root cause of a problem. In 2011, the company introduced dynamic integration capabilities to support mashups, as well as a personalization mode that leverages the underlying security model to tailor the end-user experience. While relatively few references responded on behalf of myDials, those that did indicated that they selected the product for functionality and ease of use for end users. Feedback was stellar, with very high ratings for dashboard, scorecard and visualization capabilities, and overall top-quartile product functionality ratings. Customer and sales experience marks were in the top quartile too, indicating a satisfied customer base. While the average tenure of references was less than two years, none indicated any plans to replace the software in the foreseeable future.

In 2011, U.S.-based PivotLink, a cloud-based PaaS provider for business analytics, recommitted itself to the retail sector — the place where it got its start over a decade ago. The company plans to maintain customers in other sectors indefinitely. PivotLink's management team was refreshed with key appointments such as CEO and chief marketing officer (CMO) during the year. Existing references indicate that the product is used, on average, in workgroups of about 200 users analyzing a relatively modest amount of business data — less than 300 GB. Companies choose PivotLink for ease of use for end users, functionality, and implementation cost and effort. As a PaaS for business analytics, the company employs a subscription license scheme. The average tenure of references is four years, with none considering replacement of the product in the foreseeable future. Some firms note that the product is missing functionality, which impedes broader deployment. But customers rave about support, where ratings scored in the top quartile. References reported that they think highly of PivotLink's recently introduced mobile BI platform, with exceptionally high product and user scores. Overall product functionality is rated above the average of all vendors in this report, with specific kudos for the product line's Microsoft integration options. In the increasingly crowded cloud/SaaS analytics space, PivotLink must continue to differentiate its products in order to remain competitive.

Departmental, Workgroup, Midmarket and Other BI Providers

A number of other vendors have gained market traction, but do not have the same market awareness as the BI market contenders. A few such companies, including Altosoft, Bitam, InetSoft Technology, JackBe, MeLLmo, Phocas and SpagoBI, should also be considered specific types of workload and/or business use cases.

U.S.-based Altosoft offers a BI platform which is engineered to provide rapid, no-coding development of reporting and dashboard applications with high performance through the use of a data integration and analytics engine (MetricsMart) that utilizes server-side memory and incremental preprocessing techniques. It also competes by promoting its data mapping, real-time metrics, outlier identification, user-defined alerts, and incident management features. Shipping product since 2006, it has its roots in the business process management space, and 80% of its 500 customers come from vendors that license Altosoft products to provide both conventional BI capabilities and business process intelligence functions. The other 20% of its customers are gained by competing against traditional BI platform vendors, especially in the financial services and healthcare markets. Altosoft's solution offers both traditional on-premises and a SaaS-based option which can be deployed in a hybrid configuration to allow data to be collected and processed behind a customer's firewall, then use a MetricsMart with dashboards/reports in the cloud. References indicate that they selected Altosoft for end-user ease of use, implementation cost and effort, along with its data integration capabilities.

Founded in 2000 in Mexico, Bitam is a BI and CPM vendor. Regional headquarters are located in the U.S. and Spain. The majority of its business is sold in Latin America. The Artus product's current version is G6, and includes new functionality for offline interactive dashboards and user-driven mashup capabilities. Customers choose Bitam primarily for functionality, ease of use for end users, and license costs. Bitam's SaaS option — KPI Online — is targeted at SMBs, and consists of predefined financial and customer applications as well as CPM functionality, and a development platform to create custom BI applications. Customers pay for the service on a month basis based on number of applications, users and amount of data stored in the system. References continue to flag support as a concern (a noted issue last year), and the product received lower than average product functionality ratings compared to other vendors in the Magic Quadrant analysis. The company's brand recognition is very low outside its home markets in Latin America, which further limits its ability to expand its customer base outside those markets. Unfortunately, Bitam did not receive the required number of references to be included in the main section of this report. We hope to see it return in 2013.

InetSoft Technology is headquartered in the U.S. and is a dashboard and reporting vendor with more than 3,000 clients in many geographies. The company sells directly as well as through more than 200 OEMs. In addition to a paid version of its software, the

company also makes a free download available for evaluation and individual use. References report that the product is used by relatively small groups of users (approximately 160 on average, compared with other vendors profiled in this report) on datasets of less than 200 GB. In 2011, support for mobile devices was broadened, allowing users to access dashboards on iOS devices. Prior to this, dashboards could be accessed on any Flash-enabled device. Companies select InetSoft for functionality, as well as ease of use for developers and end users. In 2011, dashboards — an acknowledged specialty for InetSoft — were rated in the top quartile for functionality by references.

U.S.-based JackBe delivers real-time BI product capabilities through its Presto product line. The firm is very clear about its real-time BI mission, and provides integration and mashup functions that are deployed in operational intelligence scenarios. Clients create applications such as real-time data center monitoring, sales and service performance, and program management — often integrated within a portal or mobile application. No client references claim that Presto is their BI standard, but references report exceptionally broad deployments, in the thousands of users — something many "standard" BI platforms can't always claim. Customers indicate that they select JackBe Presto for its data access and integration capabilities, its development ease of use, and its strengths in information infrastructure integration, indicating that the products are used to develop easy to use applications for business users. Not surprisingly, clients give high scores to Presto's development tools, and top-quadrant ratings to overall product functionality. Concerns were noted over the product's capability to support large numbers of users; this was a surprise, given that the average reference deployment exceeded 3,500 users. The products appear well suited for intended use cases, and we expect to see more from JackBe in the upcoming year as it fleshes out its real-time BI messaging.

MeLLmo was founded in 2008, is headquartered in the U.S., and was included in Gartner's "Cool Vendors in Analytics and Business Intelligence, 2011" for its flagship product Roambi Analytics — a native application that brings a set of intuitive and engaging BI visualizations to the iPad and the iPhone, as well as some BlackBerry devices. Customers can select from three options — the cost-free Roambi Lite, for individual use, and Roambi Pro, for workgroups, are both delivered in a hosted architecture as entry-level tools with limited connectivity options. The enterprise option — Roambi ES — is delivered on-premises and integrates with the megavendors' (IBM, Microsoft, SAP and Oracle) BI platforms, among others. The product is able to provide offline navigation of previously downloaded information from those sources. MeLLmo has recently introduced Roambi Flow, a tool for embedding Roambi Analytics outputs with other text and multimedia content into a digital magazine or presentation format for iPad consumption.

Phocas, headquartered in the U.K., is a subscription-based BI platform, positioning its products directly to business users. Defined integration to many major ERP and CRM systems, including Epicor, Microsoft Dynamics and Infor, is noted as a specific strength; a whopping 87% of references indicated that they selected Phocas for its ease of use. Average deployments of Phocas incorporate less than 100 GB of data and fewer than 50 users, which is not surprising given the applications it integrates with most frequently. The named-user subscription license is term-based (a minimum of six months), and the average tenure of reference customers was 4.4 years, indicating long-term use of the platform. The company will entertain a server-based license model, but only suggests it when more than 100 users will use the software. Use-case complexity scores are above average for all vendors in this Magic Quadrant analysis, and clients rate ad hoc query and metadata management in the top quartile. With over 750 customers throughout Europe, Australia and North America, the product is available in major European languages, with Chinese slated for inclusion in 2012. Customers are bullish about Phocas' future, and we expect to hear more about the firm throughout 2012 and beyond.

SpagoBI is a 100% open-source BI platform sponsored by Engineering Group, one of Italy's leading IT consultancies. Engineering Group delivers services on top of SpagoBI, using the product to build out vertical applications and specific projects on behalf of customers. Gartner sees demand for open-source solutions increasing, especially from the public sector. SpagoBI is freely available, with no license fee. Consulting or support charges are separated from free software availability, with no user lock-in and no customer obligation to buy. Support is offered in English, French and Italian. A small number of SpagoBI references responded to the Magic Quadrant survey, but we can derive some information about the product and its uses. References — all from Western and Central Europe — indicate that they use the product in small workgroups of approximately 50 users on small amounts of data (slightly less than 50 GB on average). Large user communities (in the hundreds) are also using the product. References report heavy use of report viewing and interactive exploration functions. Clients indicate that they select SpagoBI for performance considerations, followed by license cost and implementation costs/efforts.

[Return to Top](#)

VENDORS DROPPED

Bitam and Domo (formerly Corda Technologies) were dropped from this year's Magic Quadrant as both vendors did not meet the minimum number of reference survey responses required.

[Return to Top](#)

Inclusion and Exclusion Criteria

To be included in the Magic Quadrant, vendors must generate at least \$15 million in BI-related software license revenue annually. Gartner defines "total software revenue" as revenue that is generated from appliances, new licenses, updates, subscriptions and hosting, technical support, and maintenance. Professional services revenue and hardware revenue are not included in total software revenue (see "Market Share Analysis: Business Intelligence, Analytics and Performance Management, Worldwide, 2010").

Those that also supply transactional applications must show that their BI platform is used routinely by organizations that do not use their transactional applications.

Vendors must deliver at least nine of 14 capabilities detailed in the Market Definition/Description section above.

They must be able to obtain a minimum of 30 survey responses from customers that use the vendor's product as an enterprise platform.

This year's Magic Quadrant customer survey included vendor-provided references, as well as survey responses from BI users from Gartner's BI Summit, as well as respondents from last year's survey. There were 1,364 survey responses, with 120 (8.8%) from non-vendor-supplied reference lists. To ensure the integrity of the survey data, each survey response was checked by company respondent email. For survey responses from non-identifiable email accounts such as Gmail or Yahoo accounts, the respondent was contacted and had to provide Gartner with a company email address, a company role and other contact information (this amounted to fewer than 10 responses, all of which were vetted and ultimately included). Further details of the survey results will be published in the forthcoming

reports: "BI Platforms User Survey, 2012: How Customers Rate Their BI Platform Vendors;" "BI Platforms User Survey, 2012: How Vendor Customers Rate Their BI Platform Functionality;" and "BI Platforms User Survey, 2012: How Customers Rate Their BI Platform Ownership Costs (BIPOC)."

[Return to Top](#)

Evaluation Criteria

ABILITY TO EXECUTE

Vendors are judged on their ability and success in making their vision a market reality. In addition to the opinions of Gartner's analysts the scores and commentary in this document are based on three sources: customer perceptions of each vendor's strengths and challenges derived from BI-related inquiries with Gartner; an online survey of vendor customers conducted in late 2011, yielding 1,36 responses; and a vendor-completed questionnaire about the vendor's BI strategy and operations.

Product/Service:* How competitive and successful are the goods and services offered by the vendor in this market? This includes current product/service capabilities, quality, feature sets and skills, whether offered natively or through OEM agreements/partnerships.

Overall Viability: What is the likelihood of the vendor continuing to invest in products and services for its customers? Viability includes an assessment of the overall organization's financial health, the financial and practical success of the business unit, and the likelihood of the individual business unit to continue to invest in the product, continue to offer the product and advance the state of the art within the organization's portfolio of products.

Sales Execution/Pricing:* Does the vendor provide cost-effective licensing and maintenance options? This covers the technology provider's capabilities in all presales activities and the structure that supports them. This includes deal management, pricing and negotiation, presales support and the overall effectiveness of the sales channel.

Market Responsiveness and Track Record: Can the vendor respond to changes in market direction as customer requirements evolve? This covers the ability to respond, change direction, be flexible and achieve competitive success as opportunities develop, competitors act, customer needs evolve and market dynamics change. This criterion also considers the provider's history of responsiveness.

Marketing Execution: Are customers aware of the vendor's offerings in the market? This assesses the clarity, quality, creativity and efficacy of programs designed to deliver the organization's message in order to influence the market, promote the brand and business, increase awareness of the products and establish a positive identification with the product/brand and organization in the minds of buyers. This mind share can be driven by a combination of publicity, promotional, thought leadership, word-of-mouth and sales activities. This criterion was not rated separately this year and therefore was given a "no rating" in the Magic Quadrant model. Instead, our assessment of Market Execution was combined with Market Responsiveness and Track Record into one criterion on this year's Magic Quadrant.

Customer Experience:* How well does the vendor support its customers? How trouble-free is the software?

Operations: What is the ability of the organization to meet its goals and commitments? This criterion was given a "no rating." Assessment of a vendor's ability to meet its goals and commitments is incorporated into the Market Responsiveness and Track Record criterion.

* These criteria are scored either in part or directly from input from the Magic Quadrant customer survey.

Table 1. Ability to Execute Evaluation Criteria

Evaluation Criteria	Weighting
Product/Service	high
Overall Viability (Business Unit, Financial, Strategy, Organization)	high
Sales Execution/Pricing	high
Market Responsiveness and Track Record	standard
Marketing Execution	no rating
Customer Experience	high
Operations	no rating

Source: Gartner (February 2012)

COMPLETENESS OF VISION

Vendors are rated on their understanding of how market forces can be exploited to create value for customers and opportunity for themselves. Like the Ability to Execute criteria, in addition to Gartner analysts' opinions, the Completeness of Vision scores and commentary in this document are based on three sources: customer perceptions of each vendor's strengths and challenges derived from BI-related inquiries with Gartner; an online survey of vendor customers conducted in late 2011, yielding 1,364 responses; and a vendor-completed questionnaire about the vendor's BI strategy and operations.

Market Understanding:* Does the vendor have the ability to understand buyers' needs, and to translate those needs into products and services?

Marketing Strategy: Does the vendor have a clear set of messages that communicate its value and differentiation in the market?

Sales Strategy: Does the vendor have the right combination of direct and indirect resources to extend its market reach?

Offering (Product) Strategy: Does the vendor's approach to product development and delivery emphasize differentiation and functionality that maps to current and future requirements? The major business analytics market growth drivers described in the Market Overview section of this report were used as a rubric to assess both the Offering (Product) Strategy and Innovation

criteria, which are combined into one score this year.

Business Model: How sound and logical is the vendor's underlying business proposition? Note that this criterion has been given "no rating" because all vendors in the market have a viable business model.

Vertical/Industry Strategy: How well can the vendor meet the needs of various industries, such as financial services or the retail industry?

Innovation: How well does the vendor direct related, complementary and synergistic layouts of resources, expertise or capital for investment, consolidation, defensive or pre-emptive purposes? How well does the vendor exploit current or new technologies and combine them in a novel way to address a market need? Innovation and Offering (Product) Strategy are combined into one score for the purpose of this year's Magic Quadrant.

Geographic Strategy: How well can the vendor meet the needs of locations outside its native country, either directly or through partners?

* This criterion is scored either in part or directly from input from the Magic Quadrant customer survey.

Table 2. Completeness of Vision Evaluation Criteria

Evaluation Criteria	Weighting
Market Understanding	high
Marketing Strategy	high
Sales Strategy	high
Offering (Product) Strategy	high
Business Model	no rating
Vertical/Industry Strategy	standard
Innovation	no rating
Geographic Strategy	standard

Quadrant Descriptions

LEADERS

Leaders are vendors that are reasonably strong in the breadth and depth of their BI platform capabilities and can deliver on enterprisewide implementations that support a broad BI strategy. Leaders articulate a business proposition that resonates with buyers, supported by the viability and operational capability to deliver on a global basis.

[Return to Top](#)

CHALLENGERS

Challengers offer a good breadth of BI platform functionality and are well positioned to succeed in the market. However, they may be limited to specific use cases, technical environments or application domains. Their vision may be hampered by a lack of coordinated strategy across the various products in their BI platform portfolio, or they may lack the marketing effort, sales channel, geographic presence, industry-specific content, and awareness offered by the vendors in the Leaders quadrant.

[Return to Top](#)

VISIONARIES

Visionaries are vendors that have a strong vision for delivering a BI platform. They are distinguished by the openness and flexibility of their application architectures, and they offer depth of functionality in the areas they address, but they may have gaps relating to broader functionality requirements. A Visionary is a market thought-leader and innovator. However, it may have yet to achieve sufficient scale — or there may be concerns about its ability to grow and provide consistent execution.

[Return to Top](#)

NICHE PLAYERS

Niche Players are those that do well in a specific segment of the BI platform market — such as reporting or dashboarding — or that have limited capability to innovate or outperform other vendors in the market. They may focus on a specific domain or aspect of BI, but are likely to lack depth of functionality elsewhere. Or they may have gaps relating to broader BI platform functionality. Alternatively, Niche Players may have a reasonably broad BI platform, but have limited implementation and support capabilities or relatively limited customer bases, such as in a specific geography or industry. Or they may not yet have achieved the necessary scale to solidify their market positions.

[Return to Top](#)

Context

This document presents a global view of Gartner's opinion of the main software vendors that should be considered by organizations seeking to use BI platforms to develop business analytics applications. Buyers should evaluate vendors in all four quadrants and not

assume that only those in the Leaders quadrant can deliver successful implementations. Year-to-year comparisons of vendor position are not always useful given market dynamics (such as emerging competitors, new product road maps, new buying centers, and/or additional market influences) and changing client concerns/inquiries since our last Magic Quadrant. Therefore, we have evaluated vendors based on these new market dynamics and have reflected the changes in our Magic Quadrant criteria evaluation weights for 2012. Any comparison to prior-year survey results reflect differences in specific customer feedback. For further guidance on the Magic Quadrant evaluation process and on how to use a Magic Quadrant, see "Magic Quadrants and MarketScopes: How Gartner Evaluate Vendors Within a Market."

Moreover, while it is tempting for the reader to apply his or her own definitions for the Ability to Execute and Completeness of Vision evaluation criteria in order to judge vendor positions, such assumptions will likely lead to incorrect conclusions. For the purpose of this analysis:

Ability to Execute is a function of a vendor's score of five measures that Gartner believes customers care about most in vendor selection. It does not equate to revenue or market share; it is highly influenced by customer responses to the BI platforms Magic Quadrant survey.

Completeness of Vision is based on the scoring of six key measures, including, but not exclusive to, "Offering (Product) Strategy." Customer survey input does influence the overall vision rating; the Magic Quadrant methodology also includes marketing and geographic strategy in this rubric.

It is important to understand these criteria while judging vendors' positions on the Magic Quadrant. These evaluation criteria are detailed in the Evaluation Criteria section of this document.

Market Overview

Gartner's view is that the market for BI platforms will remain one of the fastest growing software markets, despite sluggish economic growth in some regions. Organizations continue to turn to BI as a vital tool for smarter, more agile and efficient business. According to Gartner's annual survey of CIO technology priorities, BI and analytics has once again been named the top priority for 2012, a position has held in three of the last five years. That said, however, slow economic growth, increasingly viable low-cost alternatives and consolidation are expected to keep BI platform growth in the single-digit range in 2012 and beyond. The BI platform market's compound annual growth rate (CAGR) through 2015 is expected to be 8.1% (see "Forecast: Enterprise Software Markets, Worldwide, 2010-2014Q11 Update").

In 2011, the BI platform market expansion was influenced by significant increases in demand from a wide array of "users": line workers, business analysts, advanced analytic professionals, business executives, customers/constituents, partners, regulators, and IT professionals. Each user type, along with their associated use cases, brought lots of variety to BI, well beyond the core query, reporting, and analysis capabilities BI platforms have long been known for. Not surprisingly, those demands often conflicted; IT leaders collaborated with business leaders to prioritize efforts based on availability of budget, people, skills, technology and (hopefully) strategic alignment. With purchases rapidly expanding in lines of business, vendors are challenged to serve multiple masters. This expansion is not a temporary aberration, but a sea change for the business analytics marketplace, and by extension for the BI platform market.

Gartner has identified the following six trends that directly impact the direction of the BI platforms market.

[Return to Top](#)

1. Differences Between Business Users and IT Drive Product Preferences

The crux of the conflict remains the same as last year: business users demand easy to use, flexible products that put analytic power into their own hands, against IT's desire to maintain standards and create a supportable BI environment with predictable performance and quality data. These different points of view are evident in the results of the Magic Quadrant survey, with business users identifying "ease of use" as their primary buying motivation 52% of the time, and where IT ranks "functionality" as its No. 1 priority. But the differences don't stop there.

Respondents to this year's survey identified themselves by role. The 1,364 organizations were split as follows:

IT — 38.9%.

Business user — 20.8%.

Blended business and IT responsibilities — 40.3%.

As stated above, IT (as well as the blended group) indicated functionality as the primary driver, followed by end-user ease of use and data access/integration capabilities. A majority of business users flagged ease of use, followed by functionality and integration. The responses are different — but not that different. What follows are some observations that point out unique points of view that contribute to the business vs. IT conundrum. In all cases, the blended business and IT group was somewhere between business and IT attitudes.

Standards matter to IT, but not so much to business users. Business users are more willing to find products that suit the use case(s) at hand. IT wants to leverage a standard platform as broadly as it can, often viewing potential solutions primarily through the "standards" lens.

License cost is a big concern for IT, less so for business users. While every purchase is cost-sensitive, business users are more willing to pay for what they want. IT wants to get functionality at the most modest cost.

Integration within the BI platform is important for IT, but much less so for business users. IT sees immense value in taking the platform approach to business analytics, where common metadata and metrics can be codified and reused. Business users are more flexible in their approach to using different products for different functions.

Functionality limitations are a sensitive area for IT, less so for business users. IT is often held to task when designing and

developing BI applications. When functionality is weak or missing, it puts a wrinkle in deployment plans and makes its job more difficult. Business users recognize these limitations, but can (and often do) resort to work-arounds to get the job done.

Business users are far more open to SaaS/cloud products, especially when augmenting existing functionality and analyzing data already in the cloud. They are anywhere from 60% to 100% more likely to follow that path. IT is far less likely to entertain SaaS/cloud analytics as a potential option.

2. Data Discovery Momentum Continues to Accelerate

Data discovery alternatives to enterprise BI platforms offer highly interactive and graphical user interfaces built on in-memory architectures to address business users' unmet ease-of-use and rapid deployment needs. What began as a market buying trend in 2010 has only continued to expand. Sales results for vendors in this sector have been stellar and well above the market average. The two branches of BI can be defined as follows:

Enterprise BI platforms:

Key buyers: IT.

Main sellers: megavendors, large independents.

Approach: top-down, IT-modeled (semantic layers), query existing repositories.

User interface: report/KPI dashboard/grid.

Use case: monitoring, reporting.

Deployment: consultants.

Data discovery platforms:

Key buyers: business.

Main sellers: small, fast-growing independents.

Approach: bottom-up, business-user-mapped (mashup), move data into dedicated repository.

User interface: visualization.

Use case: analysis.

Deployment: users.

The chasm between these segments continues to deepen because business users find the benefits of using data discovery tools so compelling that they make this choice despite the risk of creating fragmented silos of data, definitions and tools. This has further accentuated the need for IT organizations to back away from a single-minded pursuit of standardization on one vendor to a more pragmatic portfolio approach. Specifically, IT has been challenged to put in place new enterprise information management architecture development methodologies, and governance processes that accommodate and bridge the gap between the different buying center architectures, deployment approaches and use cases of both segments into an enterprise BI portfolio that can meet both business user and enterprise requirements. Enterprise BI providers have been slow to adapt; in 2011, some of these firms either released or announced new products in this category — most prominently MicroStrategy's Visual Insight, Microsoft's PowerView, and IBM Cognos Insight. Oracle's acquisition of Endeca also signals an intention in this space. While some of these products may not have all the bells and whistles out of the box, they have staked a claim in the data discovery realm. Some buyers with a strong platform purchase orientation will have alternatives in their chosen environment. If you look into the crystal ball, you can possibly see a future where data discovery is not a separate branch, but part of a broader BI platform solution set.

We are often asked if data discovery is a separate and unique market from enterprise BI platforms. While there are many facets to the debate, we hear buyers looking for a combination of analytic capabilities (descriptive, diagnostic, predictive and prescriptive) to meet a broad set of business use cases and requirements. We see buyers having many options across a broad array of product capability — it's not A or B, but A plus B. This leads us to conclude that the different BI styles do not constitute distinct markets today, but are variations on a broader theme...for now. See "Gartner's Business Analytics Framework" for a longer discussion of this topic.

3. The Rise of Mobile Computing Changes the Face of BI

The expansion of mobile computing devices — tablets and smartphones — has revived mobile BI by solving most of the problems that prevented success in the past. Gartner predicts that, by 2013, 33% of BI functionality will be consumed via handheld devices (see "Predicts 2011: New Relationships Will Change BI and Analytics"). That's one reason why we included it as a fourteenth platform capability in this year's BI platform definition.

The survey data bears out this rapid acceleration. More than 20% of survey respondents report that they are already using mobile BI or are piloting it. A whopping 33% plan to deploy mobile BI in 2012. By the end of 2012, a majority of organizations should have some mobility solutions in place, catapulting it to the same usage level as Microsoft integration and above predictive analytics. Use cases on deck are heavily skewed toward executive and management support using mobile devices. But there are signs that mobile BI is making inroads into other user communities — specifically field and knowledge workers — as it becomes a common mode of consumption for many. But it's quickly moving beyond consumption to a primary interaction model as well. Advanced mobile capabilities such as location awareness, write-back and native gesture support will strongly influence the types of applications developed, and buyers will demand mobile interfaces to core BI functionality sooner rather than later.

There are many mobile BI solutions in the market today. Most are extensions of existing BI platforms, others independent vendors making a name for themselves as mobile BI experts. See "Who's Who in Mobile BI" for a detailed discussion of mobile BI providers.

4. Putting the Focus on Decision Support

BI platforms have long been defined by "how" they operated. With such intense focus on the mechanics of BI, many organizations lost sight of what they set out to accomplish — to make better decisions. Decisions are the life blood of all organizations. Effective decision making at all levels of an organization separates high-performing companies from poor ones. Decision making is such a fundamental activity to the success of any organization, whether it is a for-profit, not-for-profit, or government organization, that improving it is by far the No. 1 driver of BI and analytics investment. Yet, despite significant investments in BI and analytics made in the name of improving decisions, the vast majority of organizations make thousands of decisions each day that, without consistency across decision makers and without insight into how decisions are made or their effectiveness, often have poor outcomes.

Most BI platforms are deployed as systems of performance measurement, not for decision support. This is changing as organizations are recognizing that analytic capabilities are just one (albeit critical) piece of the decision process. We see more use cases where users designed scenarios/models simulate possible performance outcomes and contributors iterate on the model until there is consensus on the best decision to take. Some are beginning to automate repeatable, operation decisions in analytic applications — intelligent decision automation — and implement collaborative decision-making platforms around analytic capabilities to improve the quality and transparency of tactical and strategic decisions where collaboration between decision makers is critical to the outcome.

Putting the focus on the outcome is making decision support all the more critical. See "Decision Support Capabilities in Gartner's Business Analytics Framework" for more information on this topic.

5. An Avalanche of New Use Cases and Content Types

In the Magic Quadrant survey, respondents indicated business process areas where BI was in use. The "big three" came as no surprise — more than half of all respondents indicated that finance, sales and operations analysis were implemented within their organization. Other common application areas include marketing, supply chain and customer service. But the interesting responses were categorized as "other": risk management, social media, quality management, and industry initiatives (specifically healthcare and retail).

This points to a facet of BI platforms that Gartner hears about often in inquiry — customers are expanding the use of BI products in new areas, and looking to vendors to support those moves. These areas often promulgate new requirements above and beyond the more traditional management information analysis most often associated with BI, such as:

Real-time data access: The more operational the use case, the more likely it is that real-time data becomes a necessary facet of the information infrastructure. The need to store and transform such data in a data warehouse becomes less critical, as it may require direct connection to operational applications, or analyzing information in flight and taking action on it. That data may be internally generated or come from external sources.

Hybrid content: The rise of social media analytics has given voice to the need for accessing vast, voluminous, semi-structured data — largely text-based — and analyzing the meaning/sentiment of the data. "Big data," be it technically associated with Hadoop/NoSQL data sources, or just a recognition that there are large untapped information sources out there just waiting to be understood, looms large for both business and IT leaders.

Analytic applications: Predefined analytic applications have been part of the landscape for decades. But we now see an increasing interest from buyers in evaluating whether they can buy as well as build BI-based applications on a common analytic framework in addition to custom applications from specialty vendors. These take the form of horizontal business applications tied to specific sources of data (such as Oracle's BI applications); vertically oriented applications (such as retail merchandizing systems from QuantiSense or Manthan Systems); industry data models that prescribe sources and uses of data for industry, such as healthcare or financial services; or optimization applications to forecast supply based on demand signals (such as supply chain optimization applications from SAS Institute and a variety of supply chain vendors).

Geographic-intelligent functions: When you need to know where to place a new retail outlet, or how to market to a population based on location (anyone in a specific postal code, for example) and demographics, you need to combine lots of market data from external data providers (such as Experian) and use forecasting and predictive analytic models to effectively target the right buy. It's more than just plotting results on a map; it's getting a fuller view of prospects/customers and using that knowledge to drive business process.

While these are just a few examples, they depict use cases and the variety of data that BI platforms are being asked to accommodate and represent a far broader perspective than most of today's implemented BI environments. They also portend a new set of skills that need to be fostered within business and IT organizations, as advanced analytics increasingly become the norm rather than the exception.

6. Removing Complexity From the BI Equation

There's one theme that runs through many of the BI platform Magic Quadrant survey responses: complexity. BI and analytic environments are often described as difficult to implement, maintain, develop, and use. Inquiries reinforce this, as clients describe the hoops they must jump through to manage a high-performing BI environment. This complexity factor is one of the main reasons why BI isn't more broadly deployed in more firms. Many innovations in the data discovery segment have had a direct impact on how easy the products are to use. But there are additional layers of analytic sophistication — causal analysis, predictive modeling and so on — that also need to be simplified so they can be consumed by business users, not just analytic experts. We see the beginnings of this trend emerging and expect it to have a significant impact on this market in the years to come — both for consumers and authors of business analytic content.

Cloud services may also play an important role in removing complexity from the equation. While only 30% of this year's respondents indicated that they were using or planning to use cloud-based offerings for business analytics, the number is growing, albeit slowly. Many who do use cloud analytics augment existing BI capabilities — some with specific business applications purchased from cloud analytic providers, others with PaaS options to move analytic processing to an elastic computing environment where they can scale up or scale down capacity at will. Some choose to store data in the cloud, others keep it on-premises where they feel it is more secure. Moving workloads to other providers can simplify the environment, as buyers contract for a service at an agreed-to level — all for a monthly subscription fee.

Where Is Innovation Coming From in Today's BI Platform Market?

When reviewing the 2012 BI platforms Magic Quadrant, you will notice that there are no "Visionaries" and few "Challengers." Why is that? The enterprise BI platforms market is a mature market, but it is also a constantly expanding one, with innovation coming from many quarters.

Looking back to the last big wave of market consolidation in the latter half of the past decade, large brands acquired best-of-breed products (Oracle acquired Siebel and Hyperion, SAP bought Business Objects, IBM purchased Cognos) and incorporated assets into their existing portfolios. This trend certainly continues. Large vendors continually acquired and subsumed innovative product into the portfolios. In 2011, for example, Oracle acquired Endeca, and IBM purchased Algorithmics to expand capabilities and address more use cases/industry requirements. These aren't small tuck-in acquisitions, but strategic purchases that expand market opportunity.

Smaller specialty vendors also innovate in specific functional areas or industries. They target a set of functions, such as predictive analytics, advanced visualization, geospatial analysis or cloud analytic platforms; they go deep into the healthcare of consumer packaged goods to deliver a spot-on solution to a targeted set of users. Large vendors also have the financial heft and technical breadth to fund research and development activities that innovate and broaden the appeal of their portfolios. They combine hands-on experience with thousands of customers to develop mobile applications, expand in-memory platforms, and develop function-specific engineered systems. This innovation dynamic impacts the "shape" of the Magic Quadrant participants in 2012. We expect it to continue to influence the market for BI platforms for years to come.
